A convenient short-term *in vitro* assay, the inhibition of Epstein-Barr virus (EBV) activation induced by phorbol 12-myristate 13-acetate (PMA) and sodium *n*-butyrate was conducted to detect the naturally occurring anti-tumour promoters of 133 vegetables and fruits. Forty-two plants showed strong inhibitory activity, 33 plants showed moderate inhibitory activity, 21 plants were found to be weakly active and 37 plants were inactive. *Coleus tuberosus*, Benth was chosen for further study because it showed the strongest activity. Phytosterols (CT 1) and 2 $\alpha$ ,3 $\beta$ -dihydroxyl-12-oleanen-28-oic-acid (CT 2) were isolated from *Coleus tuberosus*, Benth based on bioassay-guided fractionation. CT 1 was identified as a mixture consisting of stigmasterol (32.0%), campesterol (27.7%) and  $\beta$ -sitosterol (40.3%) by gas chromatography. CT 2 was established as 2 $\alpha$ ,3 $\beta$ -dihydroxy-12-oleanen-28-oic acid. Five plants that showed the highest anti-tumour promoting activity namely, *Carica papaya*, *Barringtonia macrostachya*, *Coleus tuberosus*, *Mangifera indica* and *Eugenia polyantha* also exhibited strong antioxidant activity compared to  $\alpha$ -tocopherol in the ferric thiocyanate (FTC) method and showed more than 60%

inhibition rate in the xanthine/xanthine oxidase system. Those plants mentioned above did not exhibit any activity in scavenging stable DPPH (1,1-diphenyl-2-picrylhydrazyl) radicals and hydrogen peroxide stimulated in differentiated HL 60 cells by PMA. Isolated compounds CT 1 and CT 2 and commercial standards campesterol, stigmasterol, and  $\beta$ -sitosterol were also tested for their antioxidant activity. Campesterol, CT 1, stigmasterol, and  $\beta$ -sitosterol demonstrated more than 50% inhibition rate in scavenging superoxide anion induced in the xanthine/xanthine oxidase system. CT 2 showed an inhibition rate of 46.62%. Campesterol, CT 1 and  $\beta$ -sitosterol showed more than 50% inhibition rate at 2  $\mu\text{g/ml}$  in scavenging hydrogen peroxide induced in differentiated HL 60 cells, but CT 2 and stigmasterol, attained an inhibition rate of only 32.97% and 16.37%, respectively. All compounds did not exhibit any activity in scavenging stable DPPH radicals. Campesterol, CT 1, CT 2, stigmasterol and  $\beta$ -sitosterol were found to have very strong anti-tumour promoting activity and their  $\text{IC}_{50}$  were determined as 2  $\mu\text{g/ml}$ , 0.7  $\mu\text{g/ml}$ , 0.1  $\mu\text{g/ml}$ , 0.6  $\mu\text{g/ml}$  and 1  $\mu\text{g/ml}$ , respectively. The optimum combination effect of stigmasterol,  $\beta$ -sitosterol and campesterol towards the anti-tumour promoting activity was obtained at 40  $\mu\text{g/ml}$  of each compound analysed by the response surface methodology (RSM). Campesterol was assessed to cause a negative interaction to  $\beta$ -sitosterol, while, stigmasterol caused a negative interaction to campesterol at concentrations higher than 20  $\mu\text{g/ml}$ . Immunoblotting analysis was used as a confirmation test for the detection of the EBV early antigen EA-D and EA-R. EA-D was detected as a darker band of about 50-52 kDa while EA-R showed up as a fade band of about 85 kDa. In conclusion, CT 1 and CT 2 were found to show strong anti-tumour promoting activity. This supports the assumption that the consumption

of vegetables and fruits is a highly recommended strategy for cancer chemoprevention and can be a practical approach to control cancer.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia  
untuk memenuhi keperluan untuk ijazah Doktor Falsafah

**AKTIVITI ANTI-PENGGALAK TUMOR BAGI SAYUR-SAYURAN DAN  
BUAH-BUAHAN MALAYSIA TERPILIH DAN PENGENALPASTIAN  
SEBATAN ANTI-PENGGALAK TUMOR DAN ANTIOXIDANT  
DARIPADA *COLEUS TUBEROSUS*, BENTH (UBI KEMILI)**

Oleh

**LIM YANG MOOI**

Mei 2002

**Pengerusi: Profesor Dr. Abdul Manaf Ali,**

**Fakulti: Fakulti Sains Makanan dan Bioteknologi**

Suatu bio-cerakin *in vitro* jangka pendek telah dijalankan iaitu perencatan pengaktifan virus Epstein-Barr (EBV) yang diaruh oleh forbol 12-miristat 13-asetat (PMA, 5  $\mu$ M) dan 3 mM natrium *n*-butirat untuk mengesan anti-penggalak tumor semulajadi dalam 133 sayur-sayuran and buah-buahan. Empat puluh dua tumbuhan telah menunjukkan aktiviti perencatan yang tinggi, 33 tumbuhan menunjukkan aktiviti perencatan sederhana, 21 menunjukkan aktiviti perencatan lemah dan 37 tumbuhan pula tidak aktif. *Coleus tuberosus*, Benth telah dipilih untuk kajian selanjutnya kerana menunjukkan aktiviti perencatan yang tertinggi. Dua sebatian iaitu satu campuran fitosterol (CT 1) dan asid 2 $\alpha$ ,3 $\beta$ -dihidroksida-12-oleanen 28-oik (CT 2) telah diperolehi daripada pokok *Coleus tuberosus*, Benth dengan mengaplikasikan teknik pengasingan berpandukan biocerakinan. CT 1 telah dikenalpasti sebagai campuran sebatian yang terdiri daripada stigmasterol (32.0%), kampesterol (27.7%) dan  $\beta$ -sitosterol (40.3%) dengan kaedah kromatografi gas. CT 2 pula telah dikenalpasti sebagai asid 2 $\alpha$ ,3 $\beta$ -dihidroksida-12-oleanen 28-oik. Lima tumbuhan terdiri daripada *Carica papaya*, *Barringtonia macrostachya*, *Coleus*

*tuberosus*, *Mangifera indica* dan *Eugenia polyantha* yang menunjukkan perencatan pengaktifan Epstein-Barr virus yang tinggi juga menunjukkan aktiviti antioksidan yang tinggi berbanding dengan  $\alpha$ -tokoferol melalui kaedah Ferik tiosianat (FTC), dan menunjukkan lebih daripada 60 % kadar perencatan dalam sistem xantina / xantina oksidase. Lima tumbuhan tersebut tidak memberi sabarang perencatan terhadap aktiviti menghilangkan radikal 1,1-difenil-2-pikrilhidrazil (DPPH) yang stabil dan hidrogen peroksida yang dihasilkan dalam sel-sel HL 60 yang telah distimulasikan untuk melalui proses perbezaan oleh PMA. Ujian aktiviti antioksidant pada sebatian CT 1 and CT2 dan komersial piawai iaitu stigmasterol, kampesterol dan  $\beta$ -sitosterol juga dijalankan. CT 1, stigmasterol, kampesterol dan  $\beta$ -sitosterol telah terbukti menunjukkan kadar perencatan melebihi 50% dalam sistem xantina / xantina oksidase. CT 2 menunjukkan kadar perencatan pada 46.62%. CT 1, kampesterol dan  $\beta$ -sitosterol merencat penghasilan hidrogen peroksida dalam sel-sel HL 60 yang telah melalui pembezaan pada kadar perencatan melebihi 50% pada kepekatan 2  $\mu\text{g/ml}$ . CT 2 dan stigmasterol masing masing menunjukkan 32.97% dan 16.37% kadar perencatan pada kepekatan 2  $\mu\text{g/ml}$ . Sebatian ini juga tidak menunjukkan sebarang aktiviti menghilangkan radikal DPPH yang stabil. CT 1, CT 2, stigmasterol, kampesterol dan  $\beta$ -sitosterol telah menunjukkan aktiviti anti-penggalak tumor yang tinggi dan memberi  $\text{IC}_{50}$  pada 0.7  $\mu\text{g/ml}$  (CT 1), 0.6  $\mu\text{g/ml}$  (stigmasterol), 1  $\mu\text{g/ml}$  ( $\beta$ -sitosterol), 2  $\mu\text{g/ml}$  (kampesterol) dan 0.1  $\mu\text{g/ml}$  (CT 2). Kesan kombinasi optimum stigmasterol, kampesterol dan  $\beta$ -sitosterol bagi aktiviti promoter tumor telah dicapai pada 40  $\mu\text{g/ml}$  bagi setiap sebatian yang dianalisiskan melalui kaedah gerakbalas permukaan (RSM). Kampesterol telah ditaksir untuk menyebabkan interaksi negatif kepada  $\beta$ -sitosterol, sementara, stigmasterol pula menyebabkan interaksi negatif kepada kampesterol pada konsentrasi yang lebih

tinggi daripada 20 µg/ml. Analisis imunokedap dengan menjalankan Western blotting dapat digunakan sebagai ujian pemastian bagi pengesanan antigen EA-D dan EA-R. Antigen EA-D dan EA-R telah dikesan melalui kaedah imunokedap sebagai jalur hitam pada kira-kira 50-52 kDa dan jalur kabur pada kira-kira 85 kDa. Pada kesimpulannya, CT 1 and CT 2 menunjukkan aktiviti promoter anti-tumor yang tinggi. Ini menyokong anggapan iaitu memakan sayur-sayuran and buah-buahan adalah satu strategi yang amat disyorkan bagi rawatan kanser secara kimo-pencegahan dan merupakan pendekatan yang praktikal untuk mengawal kanser.

## ACKNOWLEDGEMENTS

I wish to express my sincere appreciation and deepest gratitude to my supervisor, Professor Dr. Abdul Manaf Ali, and co-supervisors, Professor Dr. Md. Nordin Haji Lajis, Associate Professor Dr. Norhanom Abdul Wahab, and Associate Professor Dr. Raha Abdul Karim for their invaluable guidance, advice, constructive comments and encouragement during the execution of my project and preparation of this thesis.

Special thanks to Professor Dr. K. Koshimizu and Associate Professor Dr. A. Murakami for arranging an opportunity for me to spend three weeks in their laboratory at Kinki University, Japan. My thanks also goes to Miss Megumi Kadota, Mr. Toyota, Mr. Takao Inoue and Miss Yamamoto for their help during my stay in Japan.

My utmost appreciation to Associate Professor Dr. Khozirah Shaari from Laboratory of Phytomedicine, Institute Bioscience, UPM for her help, ideas and guidance. My deep appreciation is also extended to Dr. Jasbir S. Dhaliwal and Mr. Quek in Immunology Division, IMR Kuala Lumpur, Mr. Ashril in Sports Centre, Miss Uma in Molecular Biology laboratory, University of Malaya, Mr. Dharma Permata and Puan Habsah in Chemistry Laboratory, Universiti Putra Malaysia for their help and advice. Special thanks goes to my friends Dr. Majid, Anthony Ho, Law Sen Yu, Yu Li Ling, Ernie, Kok Yih Yih, Madiha, Tan Boon Keat and Khor Tin Oo for their help and support.

Lastly, I would like to express my utmost gratitude, indebtedness and appreciation to my grandmother, parents, brothers, and sisters, my beloved husband and parents-in-law for their love, support and encouragement that inspired me to accomplish this study.

TMS	:	Tetramethylsilane
TPA	:	12- <i>O</i> -tetradecanol-phorbol-13-acetate
UV	:	Ultraviolet
XOD	:	Xanthine Oxidase
μ	:	Micro
%	:	Percentage
δ	:	Chemical shift
λ <sub>max</sub>	:	In UV spectroscopy, the wavelength at which maximum absorption occurs
