NUMERICAL ANALYSIS OF TUBERCLES LEADING EDGE FOR UNMANNED AERIAL VEHICLE COMPOSITE WING

By

ERNNIE ILLYANI BINTI BASRI

January 2020

Chair: Kamarul Arifin bin Ahmad, PhD
Faculty: Engineering

The demand of Unmanned Aerial Vehicle (UAV) technology received growing interest from today's engineers in designing and manufacturing the products within a short time and at reasonable price. The wide availability of modern and developing composite materials and the aid of computer systems had made the demand becoming possible and achievable. The proposed research consist of fundamental numerical work and experimental work. The study applied the Finite Element (FE) analysis and developed a standardized numerical approach for structural optimization subjected to tubercles design at the leading edge of NACA4415 wing with composite material, known as FE-ACP simulation. The study is crucial in order to optimize the structural behavior of spherical tubercles pattern at the leading edge of straight, untapered and unswept wing. The previous studies proved its superior aerodynamic advantages from computational fluid dynamics (CFD) perspective on the same tubercles design. Therefore, structural characteristic including the external and internal components of the wing should be taken into consideration to achieve the superiority of high strength-to-weight ratio in regards to the application of UAV. Up-to-date, the simulation software, ANSYS is widely used in solving the FE problems subjected to composite materials. The composite modelling of the wing design is developed using ANSYS Composite PrePost (ACP) module, whereby a preliminary simulation is prepared in terms of the designation of composite materials and its impact of wing deformation. In details, the parametric study is carried out, by which the structure of the wing is optimized through optimal composite ply orientation and optimal design configuration subjected to wing stiffness and also criticality of loading requirements for structural failure. Failure criteria of Tsai-Wu and Hashin play important role in determining the optimal design of tubercles wing subjected to strength and stiffness, which is able to be obtained. The experimental study of the designation of composite at the wing skin is conducted in order to prove the simulation validity through material

characteristics. Hence, from this study, 50.27% improvement is obtained by applying the TLE wing design with semi-monocoque-foam-reinforced proven the significant of current research area on optimal performance of wing in the perspectives of composite structural optimization.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia
sebagai memenuhi keperluan untuk ijazah Doktor Falsafah

**ANALISIS BERANGKA PADA PINGGIR DEPAN TUBERKEL SAYAP
KOMPOSIT PESAWAT UDARA TANPA PEMANDU**

Oleh

ERNNIE ILLYANI BINTI BASRI

Januari 2020

Pengerusi: Kamarul Arifin Ahmad, PhD
Fakulti: Kejuruteraan

Permintaan untuk teknologi pesawat udara tanpa pemandu (UAV) mendapat perhatian yang semakin meningkat dari jurutera hari ini bagi merekabentuk dan pembuatan produk dalam masa yang singkat dan pada harga yang berpatutan. Ketersediaan luas bahan komposit dan bantuan sistem berkomputer yang moden dan berkembang maju telah membawa kepada permintaan ini menjadi mungkin dan boleh dicapai. Penyelidikan yang dicadangkan merangkumi kerja-kerja asas berangka dan eksperimen. Kajian ini menggunakan analisis unsur terhingga (FE) dan pendekatan berangka berpiawai yang telah dibangunkan untuk pengoptimuman struktur tertakluk kepada rekabentuk tuberkel pada pinggir depan sayap NACA4415 dengan bahan komposit, yang dikenali sebagai simulasi FE-ACP. Kajian ini sangat penting untuk mengoptimumkan tingkah laku struktur ke atas corak tuberkel berbentuk sfera terletak pada pinggir depan sayap yang lurus, tidak tirus dan tidak tersapu. Kajian terdahulu telah membuktikan ianya menunjukkan kelebihan aerodinamik yang unggul dari perspektif pengkomputeran dinamik bendalir (CFD) pada rekabentuk tuberkel yang sama. Oleh itu, ciri-ciri struktur merangkumi komponen-komponen sayap luaran dan dalaman yang perlu dipertimbangkan bagi mencapai keunggulan nisbah tinggi kekuatan-kepada-berat dalam aplikasi UAV. Sehingga kini, perisian simulasi, ANSYS telah luas digunakan dalam menyelesaikan masalah berkaitan FE yang dikaitkan dengan bahan-bahan komposit. Pemodelan komposit pada rekabentuk sayap telah dibangunkan dengan menggunakan modul ANSYS Komposit Sebelum/Selepas (ACP), di mana simulasi awal disediakan dari segi penentuan bahan komposit serta kesan terhadap ubah bentuk sayapnya. Secara terperinci, kajian parametrik telah dijalankan, yang mana struktur sayap dioptimumkan melalui orientasi piawai komposit yang optimum dan konfigurasi rekabentuk yang optimum tertakluk kepada kekakuan sayap dan juga keperluan bebanan yang kritikal untuk menentukan kegagalan

struktur tersebut. Kriteria kegagalan iaitu Tsai-Wu dan Hashin memainkan peranan penting dalam menentukan rekabentuk sayap tuberkel yang optimum tertakluk kepada nisbah tinggi kekuatan dan kekakuan, yang mana ianya telah dapat diperolehi. Kajian eksperimen tentang penetapan komposit pada luaran sayap telah dijalankan juga bagi membuktikan kesahihan simulasi melalui ciri-ciri bahan. Oleh yang demikian, sebanyak 50.27% pembaikan diperolehi dengan menggunakan sayap TLE bersama rangka tunggal-berbusa yang diperkuatkan membuktikan kepentingan bidang penyelidikan yang terkini ke atas prestasi sayap optimum dalam perspektif pengoptimuman struktur komposit.

ACKNOWLEDGEMENTS

First and foremost, I would like to express my greatest gratitude to my supervisor, Associate Professor Ir. Dr. Kamarul Arifin bin Ahmad for his guidance, which enable me to complete this research work successfully. Also, to my co-supervisors, Professor Ir. Ts. Dr. Mohamed Thariq bin Hameed Sultan and Professor Faizal bin Mustapha for their thoughtful supervision and valuable suggestion throughout my study.

I would like to thank Universiti Putra Malaysia for providing me the best facilities and conducive environment throughout my postgraduate study period. Special thanks to my colleagues, Mr. Firdaus bin Abas, Mr. Farid bin Bajuri, Dr. Ain Umaira binti Md Shah, Dr. Syafiqah Nur Azrie binti Safri, for their continuous support with fruitful ideas and comments. Thousand thanks to Dr. Adi Azriff Basri for his guidance in teaching and exposing me towards mastering the software of ANSYS, specifically in the analysis of composite and ANSYS Workbench. Not to forget, thousand thanks to Laboratory of Composite, UPM for giving me the opportunity to use their facilities for experiment.

My sincere gratitude and deepest appreciation to my parents, Maria Zulyani binti Mohd Zain and Basri bin Roslan whose continuously support and encourage for my long life journey of learning. Not to forget my family members, Nur Khairiyah binti Basri, Khairul Ikhwan binti Basri, Anis Syahirah binti Basri for their continuous encouragement.

My utmost gratitude and thanks to my husband, Adi Azriff bin Basri, for his constant source of motivation and splendid support during the challenges of graduate school and life. He is the one who stood by me through thick and thin with patience and tolerance during my entire study. And, also the one that ensure to finish my PhD completely and successfully.

I am also indebted to every individual for their involvement directly and indirectly throughout this research. I really appreciate their relevant comments and encouragement during my research period. Thank you for always being there and making this pursuit a valuable journey.

This thesis was submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfilment of the requirement for the degree of Doctor of Philosophy. The members of the Supervisory Committee were as follows:

Kamarul Arifin bin Ahmad, PhD

Associate Professor Ir.

LIST OF ABBREVIATIONS

ACP	ANSYS Composite PrePost
AoA	Angle of Attack
CAD	Computer Aided Design
CFD	Computational Fluid Dynamic
CLT	Classical Laminate Theory
FE-ACP	Finite Element-ANSYS Composite PrePost
FEA	Finite Element Analysis
FEM	Finite Element Method
IRF	Inverse Reserve Factor
MAV	Micro-Aerial Vehicle
MoS	Margin of Safety
RF	Reserve Factor
SR	Strength Ratio
TLE	Tubercles Leading Edge
UAV	Unmanned Aerial Vehicle

LIST OF SYMBOLS

3D	Three-dimensional
A	Amplitude
λ	Wavelength
h	Thickness of laminate
u	Displacement at x-direction
v	Displacement at y-direction
σ	Stress
ε	In-plane strain
γ	Out of-plane strain
κ	Curvature of mid-plane
$[C]$	Element stiffness matrix
F	Nodal force
δ	Displacement of nodal points of particular element
$[B]$	Matrix of strain-displacement
$[N]$	Matrix of shape vector
$[E]$	Matrix of stiffness of particular material
$[\tilde{S}]$	Shear stiffness matrix for shell element
V_f	Fibre volume fraction
ρ_f	Density of fibres
ρ_m	Density of cured resin/hardener matrix
m_f	Fibre mass
W_f	Weight fraction

CHAPTER 1

INTRODUCTION

1.1 Overview

This chapter describes the general idea of the current work. First, the theoretical foundations of this research are presented in research background and further elaborated in second section discussing on tubercles design at the leading edge of the wing. Then, in the problem statement section, the current situation in tubercles wing design configuration is discussed. The research objective is stated in the fourth section. The scope of the thesis is described in the final section.

1.2 Research background

An unmanned aerial vehicle (UAV) is a pilotless aircraft that can be remotely controlled from a ground control room. The interest in UAV development is growing in recent years due to its capabilities of utilizing relatively more reasonably priced airplanes without the on-board human operator especially when the missions involves long operational time and severe risks (Bento, 2008; Turgut, 2007). The extensive use of UAVs continued throughout the time with the development of improved UAVs capability which different kinds of UAV platforms have different mission and applications. The example of UAV for surveillance and reconnaissance applications in Malaysia is Alliance Unmanned Developmental Research Aircraft (ALUDRA MK 1), as depicted in Figure 1.1.

Figure 1.1: Aludra MK1 for surveillance and reconnaissance mission in Sabah, Malaysia

(Source: (Koo et al., 2012))

Prior to the development of UAV, the basic inspiration and motivation for flying has come from the capabilities of birds, insects and aquatic animals that able to generate efficient lift and thrust with same wing planform. This bio-inspirations attempts to produce engineered systems that possess characteristic in aeronautical applications. In fact, this attempts has inspired human towards replicated or mimicked the features and capabilities of the biological evolution in

human engineered systems. Hence, this inspiration lead to the design of new technologies and the improvement of conventional ones.

The notion of characterize animal features is far from new. Leonardo da Vinci, the first developed early blueprints for 'flying machine' inspired by a bird in adopting flapping mechanism to produce lift and thrust ((Bar-Cohen, 2006). Then, the Wright Brothers succeeded in creating and flying the first airplane off the ground by adapting the ability of pigeon's wing to create lift. Throughout the biological evolution, the increasing demand integrating the structure and functions replicated the features of animal species has driven the designers towards more simple and efficient design. Moreover, one can take biologically identified anatomical structures and their functions in engineering applications, as in Table 1.1.

Table 1.1: Biomimetics studies in engineering applications

Category	Animal	Anatomical structures	Anatomical Advantages	Engineering application	References
Flying	Birds	Limbs and feathers	The forces of lift, thrust, drag and gravity influence the flight patterns of birds	Flapping UAVs	(Bachmann & Wagner, 2011)
	Owls	Feathers	Fly silently and helps to absorb aerodynamic sound, suppress vibrations when waves of sound come crushing over the wing	UAVs Wind turbines	(Bachmann & Wagner, 2011)
	Wild geese	Wings	Ascending air current with less effort	AIRBUS	(Alerstam et al., 1990)
	Insects (dragonfly)	Multiple wings and legs	Pressure gradients for lift and thrust by flapping	small UAVs (micro aerial vehicle)	(Naqvi et al., 2015)
	Bats	Limbs	Membrane of skin that stretches between arms and leg help to produce lift	small UAVs (micro aerial vehicle)	(Naqvi et al., 2015; Norberg, 2012)
Aquatic	Whale	Flipper (Tubercles effect)	Tubercles on the leading edge produces greater lift and less drag than a smooth surface fin	small UAVs (micro aerial vehicle)	(Bushnell & Moore, 1991; Fish & Battle, 1995; Fish & Lauder, 2006; Miklosovic et al., 2007; Miklosovic et al., 2004)

Referring to Table 1.1, the basic motivation for flying has always come from millions of species of birds and insects. They efficiently generate lift and thrust using the same wing planform. Specialized feathers of the owl have the ability to fly silently with its unique wing features of trailing edge fringe and velvety down that helps to absorb aerodynamic sound (Bachmann & Wagner, 2011). Whereas, the morphology of insects is way more complex which aerodynamically produced pressure gradients for lift and thrust by flapping from multiple wings and legs. In fact, dragonfly inspired the ideas to build four-winged MAVs (Naqvi et al., 2015). Despite that, the limbs of bats also influenced flight performance such as the geometry of wings and bones, compliant skin and bones, distribution of sensory hairs across wings and physiology of musculature that drives the wings (Naqvi et al., 2015; Norberg, 2012). In the late 1990s, Frank E. Fish discovered the tubercles effect of the flipper of humpback whale, act like a wing which contributed to the superior aerodynamic maneuverability that allowing greater lift and less drag than a smooth surface fin (Fish & Battle, 1995). The humpback whale flipper received tremendous attention on the influence of rounded tubercles located on the leading edge of flippers in order to design effective wings involving aerodynamic performance (Bushnell & Moore, 1991; Fish & Battle, 1995; Fish & Lauder, 2006; Miklosovic et al., 2007; Miklosovic et al., 2004).

1.3 Emerging of bio-inspired application: Tubercles Leading Edge (TLE)

One of the baleen whale species, known as *Megapteranovaeangliae* that has massive size of 40 tons and 15 metres in length, as in Figure 1.2. The highly articulated pectoral fins with characteristic tubercles on the leading edge provide great maneuverability for hunting krill, plankton and small shoals of fish (Fish et al., 2011)

Figure 1.2: Tubercles on the leading edge of a humpback whale
(Source: Fish et al., 2011)

The humpback whale has a unique maneuvering ability to undertake sharp movements to catch prey. The sharp and high speed banking turns of the humpback whale are favoured by the high lift or drag characteristic of the combination of the tubercles and the high aspect ratio of the flippers. The tubercles provide the benefit in maneuverability and in capturing the prey by

acting as leading edge control devices to maintain lift and avoid stall at high angles of attack (Easter et al., 2013; Serres et al., 2011; Swartz et al., 2007). The presence of tubercles of the humpback whale flipper inspired the design of airplane wing and underwater vehicle. The simultaneous achievement of increased lift and reduced drag results in an increase aerodynamic efficiency. Hansen (2012) proposed the tubercle geometric parameters are amplitude, A and wavelength, λ , by which the optimal ratio for determining the shape of foil at the leading edge, as depicted in Figure 1.3.

Figure 1.3: Amplitude and wavelength of sinusoidal tubercles
(Source: Hansen, 2012)

Much progress has been made in the computational fluid dynamics (CFD) analysis to assess different external shapes based on parametric designs. In particular, aerodynamic perspective potentially gain endurance by reducing drag. However, the structural perspective also should be considered as it contributed towards weight reduction of the wing which can be translated into a lighter UAV with an increased endurance and a reduced speed stall (Landolfo, 2008). Noteworthy, Weisler et al., (2017) also highlighted the competing requirement of capability for performing in aerial (air) and underwater domains, whereby the efficient air flight requires a lower density airframe which decreases wing loading and stall speed while increasing efficiency. This may lead to serious attention for ideal aero-structural design due to the complexity of wing designs by considering other structural perspectives prior to manufacturing and testing UAVs under the real-world condition.

1.4 Problem statement

One of the critical element of aircraft is the wing design. Kumar et al., (2015) highlighted that fuselage and wing are the two essential element of aircraft, by which 80% of lift load is acted on the wings while the remaining 20% is acted on the fuselage. In today's aeronautical researches, the advancement of multidisciplinary optimisation performances and their applications towards the ideal aero-structural design is one of the main factor contributing to continuous development in UAV designs. For the TLE wing design, the complex surface element of the wavy pattern or spherical shape at the leading edge of the wing is notably increase the aerodynamic performance particularly along the center between crest and through the tubercles on the lower surface of the wing (Hansen & Horst, 2008). Though much progress of TLE wing has been made in the capability of computational fluid dynamics to analyse difference external

shapes of TLE design, the structural aspects of the design optimisation complication have not enjoyed the same attention.

There are several issues related to TLE structural design, namely:

- i. Lack of works in the structural mechanics and other possible uncertainties in materials characterization and manufacturing practices. As TLE is the current wing design, many researchers focused on the aerodynamic aspects. Hence, there is a knowledge gap in the structural analysis
- ii. Knowledge gap in understanding the role of structure wing components such as spars and ribs or other alternative reinforcement of the wing (Aftab & Ahmad, 2017; Kanesan et al., 2014)
- iii. Lack of extensive use of computational structural analysis tools for high fidelity design analysis
- iv. Limitation information on the design flexibility and structural dimensional stability with requirement of the high strength-to-weight ratio to meet the demand of modern UAV

Therefore, the current work employs ANSYS Composite Prepost (ACP) module, known as FE-ACP provide superior performance of aero-structural design of TLE wing under various conditions. In addition, the limitations of complexities in the design of TLE wing can be technically solve with the aid of fidelity analysis. Hence, the current FE-ACP can provides the structural response in technical perspectives such as loading and related structural-material stiffness in order to observe the optimal aero-structural performance of the developed TLE of UAV wing.

The simulation based on the structural and manufacturing aspects such as realistic airfoil for UAV models, geometrical shape, ease of manufacture, surface finish quality and price for preparing the materials of TLE wing may provide better understanding on the structural and composite response of complex design of TLE wing. The novelty of the current research work is the application of FE-ACP technique on the wing with tubercles design at the leading edge in terms of composite materials lamination and structure deformation. The mentioned issues related to TLE structural design mainly the increase studies on CFD from aerodynamic perspectives highlighted the least attention on the structural mechanics including computational structural analysis and the needs of design flexibility and structural components. Therefore, the analysis on the composite materials and loading mechanisms are the essential elements that contributed to critical findings in terms of structural efficiency on mechanical perspectives

1.5 Research objectives

The main objective of this research is to investigate the structural response of TLE wing of NACA4415 airfoil subjected to composite materials using the

application of Finite Element-ANSYS Composite Prepost (FE-ACP). In specific, this research are:

1. To determine a standard method for conventional wing by conducting two validations of numerical structural analysis and experimental tests.
2. To carry out the real work of 3D numerical analysis of FE-ACP to investigate the structural performance of TLE wing design
3. To investigate the optimal composite ply orientation and optimal design configuration subjected to wing stiffness and also criticality of loading requirements for structural failure

1.6 Scope of work

This research focus on the structural investigation of the static wing structure of NACA4415 airfoil with additional design of tubercles at the leading edge of the wing, known as tubercles leading edge (TLE). In order to prepare the standard technique of presenting the investigation of the wing structure of TLE, the basic understanding needed to be developed from the design of conventional wing with clean leading edge. Hence, the real work on TLE wing with composite materials is performed with regards to the presence of rib-reinforcement of spars and ribs that support the whole wing structure. Several parameters are taken into consideration such as total deformation, stress and strains. The total deformation defined the structural characteristic of the wing models, whereby all the stresses and strains data characterized the material behaviour under applied loading conditions. Besides that, experiment testing on the laminated composite materials of conventional wing skin is also investigated to understand the material behaviour under tensile and flexural loading. This research is mainly to understand the structural behaviour according to additional tubercles patterns at the leading edge as well as to investigate the composite materials impacts towards the whole structure of the wing. To the best of our knowledge, less work on the structural analysis has driven this research towards optimal structural performance of the TLE wing.

1.7 Thesis outline

The thesis contains seven chapters.

- Chapter 1 provides the overview of Unmanned Aerial Vehicle (UAV), bio-inspired applications of Tubercles Leading Edge (TLE), and objectives of the research.
- Chapter 2 provides the previous works describing evolution of conventional UAV wing with normal airfoil and limitation of TLE wing. The chapter also provides the approaches in numerical simulation and experiment.
- Chapter 3 discusses on the methodology adopted in this research. The conceptual technique of finite element modeling are explained in detail. Despite that, this chapter also explains the experimental setup for flexural and tensile tests.
- Chapter 4 reveals the validation of NACA4415 composite UAV wing using FE-ACP simulation with existing research paper. The validation of

computational FE-ACP with the experimental studies are also included in this chapter.

- Chapter 5 describes the details on structural design and performance of UAV composite wing with TLE using FE-ACP.
- Chapter 6 presents the parametric studies on structural performance in terms of optimal ply orientation, monocoque-foam-reinforcement and loading requirements for failure.
- Chapter 7 gives the conclusion and recommendations for future works.

BIODATA OF STUDENT

Ernie Illyani binti Basri was born on 26th November 1989 in Kedah, Malaysia. She has been living in Jitra, Kedah and received her primary schooling from Sekolah Kebangsaan Kepala Batas, Jitra and Sekolah Kebangsaan Hulu Bernam, Selangor. Her secondary school is Sekolah Menengah Kebangsaan Khir Johari, Perak since 2001 to 2004 as she moved to Tanjong Malim, Perak. In 2005 to 2006, she went to a boarding school of Sekolah Berasrama Penuh Integrasi Gopeng in Perak. Besides received outstanding results with flying colours, she has actively participated in various competitions and sports such as sprint run represent school and district, Arabic Language Club as secretary, Petanque, and etc. She also been nominated as “Anugerah Gemilang” for the best Cumulative Grade Point Average for SPM.

Before she pursues her study of bachelor degree in Manufacturing Engineering with Management (Mechanical) in Universiti Sains Malaysia (USM) Nibong Tebal, Penang since 2008 to 20012, she went to Perak Matriculation College in Gopeng, Perak. During her degree, she has been actively joined Perodua Eco-Challenge competition, attachment with Intel Technologies in Vietnam. She also received the Yellow Belt for Lean Six Sigma as well as Dean List Award for several semesters. Since her final year degree, she has been involving with the manufacturing industries attachment. Then she became interested in pursuing her study to master degree in research area. She registered for Master of Science (MSc) in Universiti Sains Malaysia, Penang and her research interest are manufacturing and maintenance systems involving manufacturing industry. With a great experience, attachment to manufacturing company while doing her master study, she received various experience in spreading the knowledge to the industrial practitioners as well as education practitioners. Then, in September 2016, she pursued her study in PhD with research area of fundamental numerical investigations and experiment on aircraft wing. With the knowledge of her degree and master studies, she interested in implementing the manufacturing knowledge which to be embedded in the application of aerospace. She also joined ANSYS Workbench Workshop by CADD centre to gain knowledge regarding simulation. She also actively participate and organizing conference events, known as International Conference on Computational Methods in Engineering and Health Sciences (ICCMEH) for year 2015 in UPM (Malaysia), 2016 in Kyushu Institute of Technology (Japan) and 2019 in UPM (Malaysia). In 2017, she joined Fluid-Structure Interaction (FSI) workshop in USM Engineering Campus. In 2019, she also actively joined “Seminar: Next generation of engineering technology and simulation with ANSYS” in UiTM Shah Alama. During her PhD, she met and married her lovely husband, Adi Azriff bin Basri as her soul mate and who always be with her through thick and thin.
