SUPER-FAST DRYING OF BLIND-HOLED OIL PALM LUMBER (OPL)

By

LIM JIA YUAN

A Project Report Submitted in Partial Fulfillment of the Requirements

for the Degree of Bachelor of Wood Science Technology in the

Faculty of Forestry

Universiti Putra Malaysia

2018

DEDICATION

Special dedicate to my parents,

Lim Tse An and Koo Fen Fang.

My brother, Lim Jun Xian and Lim Jun Xuan.

All my beloved course mates and friends.

Thank you for all of your supports.

ABSTRACT

“Super-Fast Drying” method is a newly invented method to dry oil palm wood (OPW). This method involves drilling holes and hot pressing. From the previous study, this method could increase the drying rate of OPW with minimal defects. However, the holing appearance had limited the application of OPW in the industry. In this study, blind holing is introduced with the best holing parameter for both peripheral and core of oil palm trunk were verified. The sample size for core of OPT is cut in the size of (200 x 50 x 18) mm whereas the sample size for peripheral of OPT is (300 x 50 x 18) mm, followed by holes drilling with the depth of $\frac{1}{3}$, $\frac{1}{2}$ and $\frac{2}{3}$ hole diameter of 5,7 and 9-mm. The specimens were hot pressed and oven dried. Mechanical testing and physical testing were carried out on the sample size with 4 replications. From the findings, both holes’ diameters and holes’ depths result to significant effect on the properties. The optimum holes’ depth and holes’ diameter are $\frac{1}{3}$ and 7-mm respectively

ABSTRAK

Kaedah “Super-Fast Drying” ialah kaedah baru dicipta pengeringan kayu kelapa sawit (OPW). Kaedah ini merangkumi lubang gerudi dan tekanan panas. Berdasarkan kajian sebelumnya, kaedah ini dapat meningkatkan kadar pengeringan kayu kelapa sawit dengan karosakan yang minimum. Walau bagaimanapun, penampilan berlubang menghadkan penggunaan OPW dalam industri. Dalam kajian ini, “blind holing” telah diperkenalkan dengan parameter berlubang yang terbaik bagi OPW teras batang dan periferi batang OPW. Teras batang OPW telah dipotong dalam saiz (200 x 50 x 18) mm manakala periferi batang OPW dalam saiz (300 x 50 x 18) mm, diikuti dengan lubangan penggerudian dalam kedalaman $\frac{1}{3}$, $\frac{1}{2}$ and $\frac{2}{3}$ dan diameter lubangan of 5,7 and 9-mm. Spesimen melalui proses “hot press” dan ketuhar kering. Ujian mekanikal dan fizikal telah dijalankan pada 4 replikasi sample. Dari hasil kajian ini, kedua kedalaman lubangan dan diameter lubangan memberi kesan yang besar kepada ciri-ciri. Lubangan yang optimum adalah $\frac{1}{3}$ dan 7-mm.

ACKNOWLEDGEMENT

I wish to express my sincere gratitude to my supervisor Assoc. Prof. Dr. Edi Suhaimi Bakar for providing me an opportunity to do my final year project and also appreciate his guidance, motivation and financial support throughout this research. I sincerely thank Dr. Mojtaba Soltani for guidance and encouragement in carrying this project work.

Futhermore, I would like to thank my teammates, Chang Ying Ying, Chia Zi Bin, Wong Mui Leng, Mohd Rafsan Bin Rais and Muhammad Nadzim Bin Mohd Nazip who rendered their help during the period of my project work.

Lastly, I would like to thank my parents & friends and lab assistants, one and all who helped me to complete this project successfully.

APPROVAL SHEET

I certify that this research project report entitled “**Super-Fast Drying Of Blind-Holed Oil Palm Lumber**” has been examined and approved as a partial fulfillment for the degree of Bachelor of Wood Science and Technology in the Faculty of Forestry, Universiti Putra Malaysia.

Approved by:

.....
Assoc. Prof Dr. Edi Suhaimi Bakar

LIST OF ABBREVIATION

CPO	crude palm oil
PKO	palm kernel oil
FFB	fresh fruit bunches
EFB	empty fruit bunch
OPF	oil palm fronds
PPF	palm pressed fiber
POME	palm oil mill effluent
OPSW	oil palm solid waste
MC	moisture content
OPL	oil palm lumber
OPT	oil palm trunk
MOE	modulus of elasticity
MOR	modulus of rupture
sMOE	specific modulus of elasticity
sMOR	specific modulus of rupture
ANOVA	analysis of variance

CHAPTER 1

INTRODUCTION

1.1 Background

According to Malaysian Palm Oil Board (MPOB), oil palm (*Elaeis guineensis*) was first introduced to Malaysia as a decorative plant in 1870. It is then planted rapidly in 1960 and achieved 1.5 million hectares of oil palm trees plantation area in the year 1985 (MPOB, 2011). In the mid-20th century, Malaysia had become the biggest palm oil producer in the world. However, this record has been overtaken by Indonesia in 2006 (MPOB, 2011). In 2016, according to the overview of MPOB, Malaysia achieved 5.74 million hectares of oil palm tree plantation while based on the data of Indonesian Palm Oil Producers Association (Gapki), there are estimated 11.8 million hectares of Indonesia land denoted to oil palm tree plantations (Indonesia Investment, 2017). These data have shown the development of palm oil industries in these two countries which has created one of the most successful stories in the history of the countries' agricultural sector.

The rapid growth in oil palm industry is mainly caused by the high demand for its products which is crude palm oil (CPO) and palm kernel oil (PKO) (Crabbe *et al.*, 2001). The palm oil can be used to produce a huge variety of products especially in the food-related commodity such as cooking oil, margarine and etc. It can also use as the base for most liquid detergent, soap, and shampoos. Furthermore, it is extensively used in the cosmetic product.

Due to explosive development in palm oil industry, massive wastes are formed which include fresh fruit bunches (FFB), empty fruit bunch (EFB), oil palm fronds (OPF), palm pressed fiber (PPF), palm shells, palm oil mill effluent (POME), oil palm trunk (OPT) and etc (Embrandiri *et. al.*, 2012). These oil palm solid waste (OPSW) was formed during the tree replantation of its economic life spans. According to Erwinsyah (2008), oil palm tree reaches an average volume of 1.638m³ after its economic live span which is between 25-32 years (Erwinsyah, 2008). After this period, most of the OPT are left at the plantation area to decompose as their economic values were low. It is estimated that about 20million m³ of OPT were felled annually in Malaysia for replanting of new trees. Therefore, Indonesia and Malaysia have been concerning on the utilization of oil palm wastes over the last decade. Unfortunately, the information and knowledge about OPT are still limited.

To overcome the issues of OPSW, a lot of researches have been carried out from all over the globe. Among all the research, the intensive research is the utilization of the OPT. This is because the shortage of solid wood raw material has forced wood-based industries to find an alternative substitution for wood raw material. Furthermore, OPT is low cost, low density, safe to be handled, renewable, economically feasible and biodegradable as compared with the ordinary lumber in the market (Dungani *et. al.*, 2013). However, most of the wood manufacturers are still refuse to use OPT as raw material because it has several inherent flaws as compared to the ordinary lumber. The OPT has inconsistent weight, high moisture content (MC), high variation of density, and

high percentages of parenchyma tissues (Mokhtar *et. al.*, 2011). These properties might cause several wood drying defects such as twisting, warping and at the same time will also increase the cost of processing and manufacturing time.

These defects can be minimized by using the proper drying methods and drying conditions. Recently, there are several new improved drying technologies had been offered to produce high recovery and improved quality oil palm lumber (OPL) and also to create suitable drying schedules for OPL. “Super-fast drying” method is one of the advanced technology that been developed by Bakar *et. al.* (2016) . This method only requires 3 hours of drying process to dry OPL with minimal defects. It involved 2-step drying, which included hot plates contact drying to certain MC and high-temperature kiln drying to a targeted MC. This method is capable to dry high and low-density OPL. There are holes in the OPL samples to ease and speed up the drying process. However, the holes on the OPL have limited its application and hardly accessible to the market. Thus, this study is conducted to form blind-holed OPL where holes are drilled to a certain depth of the sample. Blind-holed forming is known as samples which have 1 sided surface with holes and another surface without holes (clear surface). Physical and mechanical properties of the blind-hole OPL were determined in this study. A better understanding and improvement of this study will help to develop economic uses for OPL and reduce the need for disposal and environmental deterioration such as pollution, forest fire, etc.

1.2 Problem Statement

According to the previous study of “super-fast drying” method, researchers found out that it is impractical to eliminate the holing process from the “super-fast drying” method. However, the dried OPL has very limited applications without removing the holes due to its holing appearance. Therefore, the blind-holed super-fast drying method is introduced in this study to form only one-sided clear surface OPL. This is to increase the potential of OPL to be used in various applications without affecting its properties as full holing dried OPL.

1.3 Justification

“Super-fast drying” method involves holes forming on the OPL samples which might affect the mechanical properties and physical properties. In this study, different depth and diameter of holes will be formed to determine the best parameters. This research will be focusing on determining the modulus of elasticity (MOE), modulus of rupture (MOR), water absorption and thickness swelling as the indicator for choosing best parameter.

1.4 Objective

1.4.1 General Objective

To identify the effect of holing parameters on the performance of super-fast drying oil palm lumber (OPL).

1.4.2 Specific Objectives:

1. To identify the effect of holing depth on the mechanical properties of super-fast dried oil palm lumber
2. To identify the effect of holing depth on the physical properties of super-fast dried oil palm lumber
