EXPRESSION OF RECOMBINANT T1 LIPASE IN *E. coli* STRAIN W USING FIFTH GRADE MOLASSES AS CARBON SOURCE

By

SITI HAJAR BINTI YUSOFF

November 2019

Chair : Suriana Sabri, PhD Faculty : Biotechnology and Biomolecular Science

T1 lipase is suitable for various industrial applications due to its thermoalkaliphilic property. However, for industrial purposes normally large scale cultures are used and the current plasmid-based expression system raised concerns for the cost of antibiotics, dissemination of antibiotics and metabolic burden that could lead to reduction of recombinant protein productivity. Furthermore, the overall production cost depends greatly on the source of carbon. Therefore, many attempts have been made to produce recombinant proteins in E. coli from molasses, a cheap carbon source. However, most E. coli cannot utilize sucrose which is the major sugar in molasses. The aim of this study is to solve these problems by expressing the recombinant lipase using genome-based expression in E. coli W. E. coli W was chosen because it is the only safe laboratory strain that can utilize sucrose and shows fast, highly oxidative sucrose metabolism with low acetate production. The objectives of this study are to clone and integrate lipase gene into E. coli W genome, to express the recombinant lipase and to optimize the production of the recombinant product. The T1 lipase gene cassettes with different promoters (tac and trc promoters) were successfully cloned and integrated into E. coli W for plasmid based and genome based expression respectively. The expression of T1 lipase in E. coli W were higher in plasmid-based expression system compared to genome-based expression system but both systems have higher expression under trc promoter (thus, it was chosen for further study). Optimization study recorded the highest expression of T1 lipase at induction temperature of 16°C, 0.8 mM of IPTG concentration and 3% of molasses in M9 medium. A combination of the approaches described above may permit the industrial scale utilization of E. coli for bioconversion of low-cost starting materials (sucrose-molasses) into industrially important enzymes. Furthermore, production of recombinant lipase from the stable expression in the genome can be a model for production of other industrially important recombinant proteins.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk Ijazah Master Sains

EKSPRESI REKOMBINAN LIPASE T1 DARI *E. coli* STRAIN W MENGGUNAKAN MOLASES GRED LIMA SEBAGAI SUMBER KARBON

Oleh

SITI HAJAR BINTI YUSOFF

November 2019

Pengerusi : Suriana Sabri, PhD Fakulti : Bioteknologi dan Sains Biomolekul

Lipase T1 sesuai digunakan untuk pelbagai kegunaan industri kerana sifat thermoalkalifiliknya. Walau bagaimanapun, untuk kegunaan industri, biasanya kultur skala besar digunakan dan sistem ekspresi berasaskan plasmid yang sedia ada menimbulkan kebimbangan untuk kos antibiotik, penyebaran antibiotik dan beban metabolik yang boleh membawa kepada pengurangan produktiviti protein rekombinan. Selain itu, kos pengeluaran secara keseluruhan sangat bergantung kepada sumber karbon. Oleh itu, banyak percubaan telah dibuat untuk menghasilkan protein rekombinan dalam E. coli dari molases, sumber karbon murah. Walau bagaimanapun, kebanyakan E. coli tidak dapat menggunakan sukrosa yang merupakan gula utama dalam molases. Tujuan kajian ini adalah untuk menyelesaikan masalah ini dengan mengeksperi lipase rekombinan menggunakan ekspresi berasaskan genom dalam E. coli W. E coli W dipilih kerana ia merupakan satu-satunya strain makmal selamat yang boleh menggunakan sukrosa dan menunjukkan metabolisme sukrosa yang sangat cepat, oksidatif dengan pengeluaran asetat yang rendah. Objektif kajian ini adalah untuk mengklon dan mengintegrasikan gen lipase ke genom E. coli W, untuk mengekspresikan lipase rekombinan dan mengoptimumkan penghasilan produk rekombinan. Kaset gen lipase T1 dengan promoter yang berlainan (promotor tac dan trc) telah berjaya diklon dan diintegrasikan ke E. coli W untuk ekspresi berasaskan plasmid dan genom. Ekspresi T1 lipase dalam E. coli W lebih tinggi dalam sistem ekspresi berasaskan plasmid berbanding sistem ekspresi berasaskan genom tetapi kedua-dua sistem mempunyai ekspresi yang lebih tinggi di bawah promoter trc (dengan itu, ia dipilih untuk kajian lanjut). Kajian pengoptimuman mencatatkan ekspresi tertinggi T1 lipase pada suhu induksi 16°C, 0.8 mM kepekatan IPTG dan 3% molases dalam medium M9. Gabungan pendekatan yang dinyatakan di atas mungkin membenarkan penggunaan skala industri *E. coli* untuk biokonversi bahan permulaan kos rendah (sukrosa-molases) ke dalam enzim penting industri. Tambahan pula, penghasilan lipase rekombinan dari ekspresi stabil dalam genom boleh menjadi model untuk menghasilkan protein rekombinan penting yang lain secara industri.

ACKNOWLEDGEMENTS

I would like to give my thanks to my supervisor Dr. Suriana Sabri for her constant guidance and understanding throughout the entire project. Furthermore, I would also like to extend my gratitude to my co-supervisor Prof. Raja Noor Zaliha for her invaluable comments, suggestions and advices in completing and improving my overall project. In addition, many thanks were also due to Dr. Adam Leow Thean Chor and all the principal investigators (PI) of the Enzyme and Microbial Technology Research Centre UPM for their helpful advices and guidance throughout the project.

Most importantly, I would like to thank my parents, family and friends for their unwavering love and support that help me to finish my work successfully.

I certify that a Thesis Examination Committee has met on 21 November 2019 to conduct the final examination of Siti Hajar binti Yusoff on her thesis entitled "Expression of recombinant T1 lipase in *E. coli* strain W using fifth grade molasses as carbon source" in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 March 1998. The Committee recommends that the student be awarded the Master of Science.

Members of the Thesis Examination Committee were as follows:

Muhajir bin Hamid, PhD

Associate Professor Faculty of Biotechnology and Biomolecular Sciences Universiti Putra Malaysia (Chairman)

Nur Adeela binti Yasid, PhD

Senior Lecturer Faculty of Biotechnology and Biomolecular Sciences Universiti Putra Malaysia (Internal Examiner)

Lionel In Lian Aun, PhD

Associate Professor Faculty of Applied Sciences UCSI University Malaysia (External Examiner)

(ZURIATI AHMAD ZUKARNAIN, PhD)

Professor Ts. and Deputy Dean School of Graduate Studies Universiti Putra Malaysia

Date: 02 February 2021

This thesis was submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfilment of the requirement for the degree Master of Science. The members of the Supervisory Committee were as follows:

Suriana binti Sabri, PhD

Senior Lecturer Faculty of Biotechnology and Biomolecular Science Universiti Putra Malaysia (Chairman)

Raja Noor Zaliha Raja Abd Rahman, PhD

Professor Faculty of Biotechnology and Biomolecular Science Universiti Putra Malaysia (Member)

ZALILAH MOHD SHARIFF, PhD

Professor and Dean School of Graduate Studies Universiti Putra Malaysia

Date: 11 February 2021

Declaration by graduate student

I hereby confirm that:

- this thesis is my original work;
- quotations, illustrations and citations have been duly referenced;
- this thesis has not been submitted previously or concurrently for any other degree at any other institutions;
- intellectual property from the thesis and copyright of thesis are fully-owned by Universiti Putra Malaysia, as according to the Universiti Putra Malaysia (Research) Rules 2012;
- written permission must be obtained from supervisor and the office of Deputy Vice-Chancellor (Research and Innovation) before thesis is published (in the form of written, printed or in electronic form) including books, journals, modules, proceedings, popular writings, seminar papers, manuscripts, posters, reports, lecture notes, learning modules or any other materials as stated in the Universiti Putra Malaysia (Research) Rules 2012;
- there is no plagiarism or data falsification/fabrication in the thesis, and scholarly integrity is upheld as according to the Universiti Putra Malaysia (Graduate Studies) Rules 2003 (Revision 2012-2013) and the Universiti Putra Malaysia (Research) Rules 2012. The thesis has undergone plagiarism detection software.

CHAPTER 1

INTRODUCTION

1.1 Background of study

Escherichia coli is a well-known microbial host for production of myriad products from recombinant pharmaceuticals to commercial enzymes. The central aspect of *E. coli* fermentation is the development of cost-efficient, abundant, and readily available carbon source to obtain maximal production yield of product of interests. The choice of carbon source for production of recombinant proteins in *E. coli* fermentation is a critical step as feedstock price represents 30.7% of the total cost (Alper and Stephanopoulos, 2009). Thus, feedstock price is a major contributor to the total bioprocess cost. Molasses, which is a waste product of sugar production from sugarcane and sugar beet, can be a suitable candidate for the requirement for biotechnological production through microbial fermentation. It is an inexpensive raw material and the costs is 33-50 % less than pure glucose (Zhang et al., 1994).

Many approaches were established to utilize inexpensive and easily available molasses as alternate feedstock in *Escherichia coli* with intention to bring down the production cost. Yet, the system was not productive for the reason that most of the *E. coli* strains are unable to utilize sucrose, which is the major sugar content present in molasses. In addition, majority of the sucrose utilizing *E. coli* strain are enteropathogenic (Jahreis et al., 2002). *E. coli* W is one of the five strains that is categorized as safe and it is the only strain that can utilize sucrose as its carbon source (Lee and Chang, 1993). Additionally, *E. coli* W showed fast, highly oxidative sucrose metabolism with low acetate production unlike other commercially used *E. coli* strains (Arifin *et al*, 2014). Therefore, it is an attractive host option to be used to produce recombinant protein industrially using a cheap waste product (molasses – major sugar is sucrose) as its carbon source.

For industrial purposes normally large-scale recombinant protein production is driven by *E. coli* carrying recombinant plasmids. A central issue during plasmid-based expression of recombinant proteins is plasmid loss due to plasmid instability (Friehs, 2004), high cost for antibiotics supplementation, as well as concerns on the probability of dissemination of antibiotic resistance organism to the environment (Pruden *et al.*, 2013). In addition, the presence of plasmids can impose a metabolic burden on the host cell, which can lead to decreased plasmid copy number in host cells and thus negatively affect the recombinant protein productivity (Mairhofer *et al*, 2013).

Alternatively, recombinant protein can be expressed in plasmid free systems. Product formation rates generated in these systems are comparable to plasmid-based ones (Streidner *et al*, 2010). The gene of interest can be integrated into a defined locus of the *E. coli* genome using a few strategies. This includes the use of pKO3 vector and homologous recombination in *rec*-proficient strains (Link *et al*, 1997), λ -site specific recombination (Landy, 2015), *recET* system (Zhang *et al.* 1998), and the more recent technique, CRISPR optimized MAGE recombineering technique (Ronda *et al*, 2016). Lastly, a study has shown an efficient and easy way to insert whole gene cassettes into *E. coli* genome with the aid of pKIKO plasmids using lambda Red recombination technique (Sabri *et al.*, 2013).

T1 lipase is a well characterized thermostable enzyme isolated from *Geobacillus zalihae* strain T1 (Leow *et al*, 2007). Many expression systems were developed using several promoters such as pBAD expression system (araBAD promoter), pRSET expression system (T7 promoter), pET22b (+) expression system (T7 *lac* promoter) and pGEX-4T1 expression system (*tac* promoter). However, the highest expression levels were recorded at 20.02 U/mg and 15.48 U/mg under *tac* promoter using *E. coli* BL21 (De3) and *E. coli* BL21 (De3) plysS, respectively (Leow *et al.*, 2007).

1.2 Problem statement

Molasses is a preferred substrate for fermentation. However, most commonly used *E. coli* strain (BL21) cannot utilize molasses efficiently because it cannot ferment sucrose (the major sugar in molasses).

Therefore, *E. coli* W which is the only safe laboratory *E. coli* strain that can catabolize sucrose might be able to efficiently utilize molasses as carbon source for stable expression of recombinant protein product. Furthermore, *E. coli* W, an efficient molasses utilizer, is a wildtype strain where recombinant enzyme production remained less explored.

1.3 Objectives

The aim of this study is to produce a stable recombinant T1 lipase expression in *E. coli* W. The specific objectives of this study are:

1) To clone and express T1 lipase in E. coli strain W and

2) To optimize the production of T1 lipase in minimal medium using molasses as carbon source.
