EFFICIENCY MEASUREMENT OF MALAYSIA'S MARITIME ENFORCEMENT AGENCIES USING DATA ENVELOPMENT ANALYSIS

By

SUTARJI BIN HAJI KASMIN

February 2003

Chairman : Professor Mohd Ibrahim bin Hj Mohamed, Ph.D.

Faculty : Science and Environmental Studies

The study is concerned with measuring the degree or amount of efficiency of Malaysia's maritime enforcement agencies in pursuing their objectives. The ideal approach in determining efficiency in non-profit organization is one which will deal with multiple inputs and outputs simultaneously. This study therefore, attempts to broaden the scope of evaluation for the efficiency of non-profit organization in that it takes account all outputs as well as inputs that are required and desirable for effectiveness and allows for simultaneous interaction in their measurement and evaluation.

The study addressed the problem of four maritime enforcement agencies that are managed sectorally and functioning independently of one another. Under this system, each agency is established to enforce law and regulations related to its establishment, develops its own organization, manpower and training structures, acquire facilities and assets to meet its own requirement, operate independent budget and financial system, and established its own working culture independent of other organisation. This system is inherent with many weaknesses such as duplication of responsibilities, lack of

coordination among enforcement agencies and lack of focus on the economic use of assets. Hence, these agencies are believed to be inefficient to the extent that their operational effectiveness is also affected.

The methodology to measure relative efficiency is the use of Data Envelopment Analysis (DEA). DEA is a technique for comparing efficiencies between units having multiple inputs and outputs. In other words, DEA is an optimisation method of mathematical programming to generalise the single-output/single input efficiency measure to the multiple outputs/multiple inputs case by constructing an efficiency ratio of a single “virtual” output to single “virtual” input. The relative efficiency of each unit is calculated by forming the ratio of a weighted sum of outputs to the weighted sum of inputs.

The study involves 22 units which comprised two units of the Royal Malaysian Navy, five units of the Marine Police, nine units of the Department of Fisheries and six units of the Royal Customs and Excise Department. Of the 22 units, 14 are located in the Peninsular Malaysia and the other eight are located in Labuan, Sabah and Sarawak. However, due to insufficient data, five units, namely one unit each of the Marine Police and the Department of Fisheries, and three units of the Royal Customs and Excise Department are excluded.

The study tended to rebut the earlier belief that maritime enforcement agencies are inefficient under sectoral management. Of the 17 units being studied, 11 units or 64.7 percent are found efficient and only six units or 35.3 percent are found inefficient.

However, the analysis also reveals three weaknesses. First, there are indication that these agencies are not performing effectively due to poor command, control and coordination among these agencies. In other words, units of these agencies are “doing things right” but not enough to “doing the right thing”. Second, the major sources of inefficiencies are due to excessive inputs and lower output. Third, sectoral management of maritime enforcement agencies is no longer suitable in environment where resources are becoming more scarce and increasing competition to replace manpower with technology.

The research finding contributed to a fund of knowledge about efficiency measurement of maritime enforcement agencies. With slight modifications, the method is adaptable to measure the efficiency of other related agencies such as units of the Malaysian Armed Forces and Royal Malaysian Police.

**PENGUKURAN KECEKAPAN RELATIF AGENSI PENGUATKUASA MARITIM
MALAYSIA MENGGUNAKAN “DATA ENVELOPMENT ANALYSIS”**

Oleh

SUTARJI BIN HAJI KASMIN

Februari, 2003

Pengerusi : Profesor Mohd Ibrahim bin Hj Mohamed, Ph.D.

Fakulti : Sains dan Pengajian Alam Sekitar

Kajian ini berkaitan dengan pengukuran efisiensi agensi penguatkuasaan maritim Malaysia. Maklumat efisiensi agensi tersebut akan menjadi kayu pengukur setakat mana keupayaan kesemua agensi tersebut melaksanakan tugas dan tanggungjawab yang telah diamanahkan. Pendekatan yang ideal dalam menentukan tahap efisiensi sesebuah organisasi awam ialah menggunakan input dan output yang berganda secara serentak.

Kajian ini dilakukan bagi mencari kepastian ke atas anggapan bahawa keempat-empat agensi penguatkuasa maritim adalah tidak efisien kerana kesemua agensi tersebut diuruskan secara sektoral dan berfungsi secara berasingan antara satu dengan yang lain. Dalam sistem sektoral seperti ini, setiap agensi ditubuhkan bagi menguatkuasakan undang-undang yang diwujudkan khusus untuk agensi tersebut tanpa mengambil kira peranan agensi lain yang sejenis dan melaksanakan peranan yang serupa. Dalam konteks ini, agensi tersebut akan membangunkan reka bentuk organisasi, sistem keanggotaan, latihan dan kewangannya mengikut acuan yang diperlukan. Oleh itu, sistem ini dikaitkan dengan pelbagai kelemahan seperti pelaksanaan tugas yang bertindih,

tahap koordinasi yang lemah dan penggunaan sumber secara tidak ekonomi. Segala kelemahan seperti ini telah memberi anggapan bahawa organisasi penguatkuasa maritim adalah tidak efisien sehingga menjejaskan keberkesanan pelaksanaan operasinya.

Dalam kajian ini, pengukuran tahap efisiensi dilakukan dengan menggunakan Data Envelopment Analysis (DEA). DEA ialah satu teknik untuk membuat perbandingan efisiensi antara unit yang mempunyai input dan output berganda secara “mathematical programming”. Dalam pengiraannya, efisiensi relatif diperolehi dalam bentuk kadar antara “weighted sum of outputs” dibahagi dengan “weighted sum of inputs”.

Dalam kajian ini, sebanyak 22 unit yang terdiri daripada dua unit Tentera Laut Diraja Malaysia, lima unit Polis Marin, sembilan unit Jabatan Perikanan dan enam unit Jabatan Kastam dan Eksais Diraja telah terlibat. Daripada jumlah ini, 14 unit terletak di Semenanjung Malaysia manakala 8 unit lagi berada di Labuan, Sabah dan Sarawak. Walaupun, 22 unit telah dibuat kajian, namun hanya 17 unit sahaja yang pengiraan tahap efisiensinya dapat dilakukan kerana lima unit yang lain tidak mempunyai data yang lengkap. Unit tersebut terdiri daripada setiap satu unit daripada Polis Marin dan Jabatan Perikanan dan tiga unit lagi daripada Jabatan Kastam dan Eksais Diraja.

Penemuan daripada kajian ini telah dapat menyangkal anggapan bahawa agensi penguatkuasaan maritim adalah tidak efisien. Sebaliknya, 11 daripada 17 unit atau 64.5 peratus daripadanya didapati efisien. Analisis selanjutnya telah mendedahkan tiga lagi kelemahan agensi penguatkuasaan maritim. Pertama, terdapat tanda bahawa agensi penguatkuasaan maritim telah tidak menyempurnakan tugas-tugasnya dengan berkesan

kerana kelemahan sistem perintah, kawalan dan koordinasi antara agensi yang berkenaan. Dengan lain perkataan, agensi-agensi tersebut telah melaksanakan tugas dengan betul (doing things right) tetapi kurang membuat tugas yang betul (doing the right thing). Kedua, punca utama yang menyebabkan enam unit tidak efisien ialah kerana penggunaan input yang berlebihan dan pengeluaran output yang sangat kurang. Ketiga, pengurusan agensi penguatkuasaan maritim secara sektoral sudah tidak sesuai lagi pada hari ini kerana sumber yang sedia ada semakin berkurangan dan kecenderungan menggantikan tenaga manusia dengan teknologi telah meningkat.

Hasil kajian ini telah memberi sumbangan kepada peningkatan ilmu pengetahuan dalam bidang pengukuran efisiensi agensi penguatkuasaan maritim. Selain daripada kegunaan untuk mengukur tahap efisiensi agensi-agensi tersebut, penemuan ini boleh disesuaikan untuk mengukur efisiensi perkhidmatan awam yang seumpamanya terutamanya untuk unit-unit dalam Angkatan Tentera Malaysia dan Polis Diraja Malaysia.

ACKNOWLEDGEMENTS

I owe a great debt to Professor Dr Mohd Ibrahim bin Hj Mohamad whose guidance, critical comments, constant encouragement and intellectual stimulation has tremendously assisted me during this period of candidature.

My sincerest gratitude extends to my co-supervisors namely Associate Professor Dr Azahari bin Ismail, Associate Professor Dr Salleh bin Yahya and Dr B. A. Hamzah whose patience, encouragement and critical comments have been a source of inspiration for me during the long hours of preparation, fieldwork, analysis and thesis preparation.

I also wish to thank the Royal Malaysian Navy especially Vice Admiral (Retired) Dato' Seri Ahmad Ramli bin Hj Mohd Nor, Admiral (Retired) Tan Sri Dato' Seri Abu Bakar bin Abdul Jamal and Admiral Dato' Mohd Ramly bin Abu Bakar who have given me the opportunity, facilities and working environment to pursue my higher education. In additions, I also wish to thank other officers and men of the Royal Malaysian Navy who have helped me to provide data, information or other assistances directly or indirectly.

I am also very grateful to the Marine Police of Royal Malaysian Police (especially Superintendents Zakaria bin Yusuf and Hj Jumaat bin Omar), the Department of Fisheries (especially Encik Solehan bin Lamin), the Royal Customs and Excise Department (especially Encik Abdullah Zawawi bin Abd Latif), the Maritime Institute of Malaysia (especially Encik Iskandar Sazlan bin Mohd Salleh), the Marine Department

Peninsular Malaysia and the National Maritime Enforcement and Coordination Centre for their kindness to provide data, information and other assistances directly or indirectly to this study. To the many senior officers, friends and colleagues especially those in the Malaysian Armed Forces Headquarters (special mention to Lieutenant Commander Abu Bakar bin Malik RMN of the Defence Operation Room), the Malaysian Army, the Royal Malaysian Air Force, Joint Intelligence Staff Division (special mention to Encik Chan Ngor Chong), University Putra Malaysia, National University of Malaysia, Malaysian Armed Forces Defence College and Institute of Diplomacy and International Relations, Kuala Lumpur who have been a constant source of encouragement and assistances.

My appreciation is due to Mr Donald Chapman and his wife, Julie of Georgia, USA for their continuous support to obtain materials on performance measurements and Data Envelopment Analysis (DEA) from various sources in the USA. Special mention of their efforts is their success to link me with Dr Iqbal Ali, one of the leading authorities on DEA.

My wife, Hjh Siti Bunia binti Hj Ab Gapar deserves special thanks for her patience, counsel, understanding and support throughout the many days, nights and weekends I spent completing this research over the last five years and for so much more. Without her, none of this would have happened.
