DEDICATION

First, thanks to Allah S.W.T for His Greatness and blessing for allowing me to finish this thesis without a hitch. I dedicate this thesis to my beloved family, devoted parents, dedicated supervisors who guided me throughout my writing, and friends who believed in me that I would go through until the end of this journey. I will not be able to go on this journey without their continuous love and support. I hope this study could be used as a future reference for those who are interested in communication technology and human communication.

Abstract of thesis presented to the Senate of Universiti Putra Malaysia in
fulfilment of the requirement for the degree of Doctor of Philosophy

CONTRIBUTING FACTORS TOWARDS ENHANCEMENT OF SOCIAL COHESION IN VIRTUAL COMMUNITIES.

By

HAMIZAH BINTI SAHHARON

November 2021

Chair : Assoc. Prof. Jusang Bolong, PhD
Faculty : Modern Languages and Communication

An ethnically heterogeneous population requires the acceptance of differing values and tolerance for diversity per se. Frequent changes within the environment lead to uncertainty in human society. Several social exchange theories have justified factors that influence social cohesion, but it was the theory of relational cohesion that illustrates the micro and macro level of human interactions. Given the rapid technological changes in society, people face changes in almost every area of the economy, society, and culture, thus maintaining social cohesion can be quite challenging because commitment requires emotional reactions. To influence a person's membership attitude and behavior towards a group, the anxiety and uncertainty management theory said the members should be cooperative, trusting, tolerate diversity, and emit positive emotions. Youth nowadays prefer spending time on social networking sites as a virtual community platform to communicate effectively. To emit cooperative, trusting, and positive attributes in virtual communities, members can communicate effectively by having tolerance for diversity. Referring to the universal-diverse orientation model, multicultural awareness is developed when people are mindful and accept both the similarities and differences among people to avoid offending others. Hence, to attain the truth about this phenomenon lies in the deductive approach based on the theoretical research framework. This research is quantitative in nature and a multi-stage homogeneous sampling approach is applied, whereby 600 youths are chosen to represent each zone for inclusivity of the youth population and equal distribution. The data is analyzed using SPSS and Partial Least Square (PLS) Structural Equation Modelling (SEM) to explore the theoretical framework. In conclusion, interaction within social networking sites or virtual communities can enhance the sense of social cohesion among Malaysian youths if they socially categorized themselves as being part of the group, feel connected to others, personally and socially identify themselves as members, and positively react to others. Rural youths especially, have better communication effectiveness in virtual

communities than their urban counterparts when they manage their level of anxiety and uncertainty through personal/social identity, motivation to interact, and situational processes. Although communication effectiveness and tolerance of diversity did not affect anxiety and uncertainty management directly in enhancing the sense of social cohesion in virtual communities, it was proven that a micro-macro level online interaction could enhance social cohesion among youth.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia
sebagai memenuhi keperluan untuk ijazah Doktor Falsafah

FAKTOR PENYUMBANG KE ARAH MENINGKATKAN KEJELEKETAN SOSIAL DALAM KOMUNITI MAYA

Oleh

HAMIZAH BINTI SAHHARON

November 2021

Pengerusi : Prof. Madya Jusang Bolong, PhD
Fakulti : Bahasa Moden dan Komunikasi

Negara yang mempunyai pelbagai kaum memerlukan penerimaan nilai budaya yang berbeza dan toleransi terhadap kepelbagaian. Perubahan yang kerap berlaku dalam arus persekitaran membawa kepada ketidakpastian kepada masyarakat. Terdapat beberapa teori pertukaran sosial yang menafsirkan faktor yang dapat mempengaruhi kejeleketan sosial, namun hanya teori *relational cohesion* yang menjelaskan interaksi manusia secara mikro dan makro. Melihat kepada perubahan teknologi yang pesat, ia dilihat dapat mempengaruhi hampir setiap pelusok ekonomi, masyarakat dan budaya, justeru itu, mengekalkan kejeleketan sosial adalah amat mencabar kerana komitmen memerlukan reaksi emosi. Untuk mempengaruhi sikap dan tingkah laku keahlian seseorang individu terhadap sebuah kumpulan, teori pengurusan kebimbangan dan ketidakpastian menyatakan bahawa setiap ahli harus bekerjasama, saling mempercayai, mempunyai toleransi terhadap kepelbagaian dan menghasilkan ruang emosi yang positif. Belia masa kini lebih gemar meluangkan masa di media sosial yang berfungsi sebagai ruang komuniti maya untuk berhubung secara efektif. Untuk membina ruang komuniti maya yang memberi kerjasama, boleh dipercayai dan membawa aura yang positif, ahli komuniti maya tersebut haruslah mempunyai toleransi terhadap kepelbagaian. Menurut model *universal-diverse orientation*, toleransi terhadap kepelbagaian hanya akan wujud jika seseorang itu sentiasa beringat dan dapat menerima persamaan dan perbezaan yang wujud bagi mengelak daripada menyinggung perasaan orang lain. Oleh itu, bagi memahami fenomena ini satu pendekatan secara deduktif diambil untuk memahami ketiga-tiga teori komunikasi yang dinyatakan sebelum ini. Kajian ini adalah bersifat kuantitatif menggunakan kaedah persampelan homogen pelbagai peringkat, seramai 600 belia dipilih untuk mewakili setiap zon bagi merangkumi setiap populasi belia dan pengagihan sama rata. Data kajian ini dianalisis menggunakan SPSS dan Partial Least Square (PLS) Structural Equation Modelling (SEM) untuk meneroka kerangka teori kajian. Secara keseluruhan, didapati bahawa interaksi dalam komuniti maya atau media sosial dapat

meningkatkan rasa kejeleketan sosial dalam kalangan belia Malaysia jika mereka mengkategorikan diri mereka sebagai sebahagian daripada kumpulan maya tersebut, mempunyai hubungan kait dengan orang lain, mengenalpasti diri mereka sebagai ahli secara peribadi dan sosial, dan bertindak balas secara positif terhadap orang lain. Belia luar bandar terutamanya, berkomunikasi secara lebih berkesan dalam komuniti maya berbanding belia bandar apabila mereka berjaya menguruskan tahap kebimbangan dan ketidakpastian melalui identiti peribadi/ sosial, motivasi untuk berinteraksi dan proses situasi. Walaupun keberkesanan berkomunikasi dan toleransi terhadap kepelbagaian tidak memberi kesan secara langsung terhadap pengurusan kebimbangan dan ketidakpastian dalam meningkatkan tahap kejeleketan sosial dalam komuniti maya, kajian ini membuktikan bahawa interaksi dalam talian di peringkat mikro dan makro dapat meningkatkan kejeleketan sosial dalam kalangan belia.

ACKNOWLEDGEMENTS

Thanks to the Almighty Allah S.W.T. for facilitating my PhD's journey, to this day I have never stopped praying for His blessings and guidance. I am humbly thankful to my beloved parents for their belief, trust, and encouragement throughout my study. They are proud parents of six who never let their one and only daughter down. They are my steppingstone into becoming a better person and striving for completion, indeed the sacrifices they made while raising me will not go in vain, for I will make sure to repay them for their patience. I also wish to express my heartfelt gratitude to the people around me who have guided me throughout my thesis, especially the chairman of my supervisory committee Assoc. Prof. Dr. Jusang bin Bolong, the members Assoc. Prof. Dr. Siti Zobidah binti Omar, and Assoc. Prof. Dr. Khairuddin bin Idris for their constructive ideas. Without their expertise and assistance, my thesis would not come around and finalize as it is. I would also like to extend my appreciation to those who taught me the application of Partial Least Square Structural Equation Modelling, to Dr. Hayrol for his all-rounded expertise in journal writing, and to my friends who gave me the will to continue my PhD journey. I thank you all for your emotional support! May Allah S.W.T repay your kindness.

This thesis was submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfilment of the requirement for the degree of Doctor of Philosophy. The members of the Supervisory Committee were as follows:

CHAPTER 1

INTRODUCTION

The first chapter of this thesis entails the study's context about human communication in general and proceeds to explain Malaysia's interethnic interaction scenario. The chapter delves through the importance of unity and challenges faced by Malaysians, especially youth regarding multicultural awareness, social acceptance, effective communication, and the level of social cohesion. The research problem, research questions, research objectives, significance of the study, and definition of keywords are included in the chapter.

1.1 Background of the study

Communication often involves a minimum of two individuals exchanging ideas, ideals, information, and many other forms of dyadic relationships. The development, maintenance and termination of a social relationship depend on the communication effectiveness because without proper feedback, the receiver will not receive nor understand each other's message. There are several barriers known to have hindered effective communication, for example, both the messages you send and the messages that you receive should get the attention of the intended receiver, the messages shared should relate to common experiences, and at least meet the personality needs appropriate to the receiver's culture and situation. The ability to communicate effectively with people from diverse cultures may result in financial gain, increase employment opportunities and advancement prospects (Devito, 2009). During social situations people should become increasingly sensitive to cultural differences and respect cultural diversity to be an effective communicator.

The term "social" has been used to explain all phenomena that happen within society involving human occurrence. Every human being function in their best interest to conduct daily commitments and obligations to the law and custom of the country they live in. Due to their distinct characteristics apart from the subject of biology and psychology, all practices in the daily lives of an individual such as their profession, religion, culture, and education functions interdependently upon one another. Living in a multicultural society would mean living with people from different ethnic backgrounds and sociocultural background, therefore the differences are vast. In consequence of social diversity, our beliefs, values, and social norms can result in negative outcomes such as irreconcilable differences and prejudice. Therefore, trying to engage the society to realize a collected sense of nationalism is challenging due to the notion of fear towards feeling uncertain and anxious.

Malaysia is a multicultural country with diverse ethnics and religions. It is customary to have cultural gaps among different ethnic groups, which is why in 1970 the 'Rukun Negara' principles were formed. They are encrypted with noble values to achieving a national identity and greater unity among the people after the racial riot that occurred on 13 May 1969 (Gill, Talib, & Jawan, 2012; Ongkili, 1974). The 'Rukun Negara' holds the national ideology to develop a sense of shared identity among citizens and build national unity through five main principles: belief in God, loyalty to King and country, nobleness of the constitution, sovereignty of the law, and courtesy and decency. In a plural society, the sharing of principals and moral values is demanding (Gill et al., 2012); hence the awareness of diversity (Awang, Ahmad, & Rahman, 2017) needs to be disseminated through early exposure from institutions such as family, school, the media, and most probably several modes of mass communication. It is essential that these values and principles be taught so that the society feels they belong to each other and transcend to other communities.

In 1971, several implementations of policies such as the National Cultural Policy (NCP) and the Malaysian National Economic Policies (NEP) were formulated to achieve national culture, national unity, harmony, and integrity. Due to the aftermath of 13 May 1969 tragedy, a proper planning of social integration is imperative because without proper planning social chaos may occur. Thus, the implementation of policies like NCP takes place as a guideline to reduce the gap between races and sustain national culture and identity (Ongkili, 1974). Along with NCP, the NEP was formulated to further promote national unity. The purpose of NEP is to implement plans to provide a fair society treatment in Malaysia to attain national integration and unity (Musa & Jalil, 2013). The policy raises hope to expedite cultural compromise in creating a national unity, which involves the nation's readiness to accept cultural and religious diversity.

Creating oneness or a sense of unity within a multi-cultural society is a challenge given the cultural and religious diversity, later in 2012 the policies were proven to have a fruitful outcome, Malaysia was ranked 64th out of 187 countries by the 2012 Human Development Index for their 1994 successful case of high human development due to their social integration policy in NEP (Mu Hung, 2014). In the past, Ongkili (1974) said the challenges of social integration are prejudice, communalism, ethnocentrism, ignorance of other ethnic groups, intra-ethnic socialization, racism, socio-economic difference, cultural differences, and segregation. These issues continue to be a concern for the government (Musa & Jalil, 2013). As of the third quarter of 2018, Malaysia has a population of 32.5 million, however, only 29.06 million are citizens consisting of 69.1% Bumiputeras, 23.0% Chinese, and 6.9% Indians (Department of Statistics Malaysia, 2018a, 2018b). Despite the constant growth in Malaysian economy, the division of economic activities and place of settlement of the three main ethnics in Malaysia has led to polarization and segregation (Raman & Sua, 2010).

In a 2006 poll on interethnic trust, it was revealed that Malaysians, especially the Malays and the Chinese, have low trust even though they have friends from different ethnic groups from theirs (Mu Hung, 2014). The reason of low interethnic trust was believed to be the lack of social contact and interethnic understanding, and programs that encourage inter-ethnic interactions. According to 97% of the respondents, interethnic interaction is critical for maintaining peace, stability, and national unity. As noted by Mu Hung (2014), the problem can never be resolved in a day; it needs to be managed, especially with the increasing number of non-Malays who constantly feel discriminated. Several factors like widespread corruption and urbanization causes inequality that has been worsened over the decades, which could erode trust in a society. As people become better educated, have greater access to information through social media, and have rising ambitions, social unrest is growing in many nations with authoritarian governments. However, as contradicted by Gill et al. (2012), a high level of skill and better education does not guarantee citizen contribution towards national development and well-being of the society.

The challenges of social transformation in Asia are manifold. The problem arises as most social activities tend to be carried out by Malay, Chinese and Indian youth organizations within their own ethnic community, which restricts their social dependence to intra-ethnic unity as opposed to inter-ethnic unity. People can be narrow-minded, prejudiced, intolerant, and irresponsible of others. As insinuated by Gill et al. (2012), ethnic relations should be nurtured periodically through Malaysia's national ideology to achieve a more congruent level of integration. Youth especially, is the most important group that should be endowed with knowledge of ethnic relations (Zainal & Salleh, 2010) as they are the ones responsible for the future of the country. Their determination to unite and active participation could promote unity. Therefore, the key features to national unity are social inclusion, social capital, and social cohesion.

Social cohesion in Malaysia

To achieve national unity in Malaysia, Shamsul Amri used the term "kesepaduan sosial" or "social cohesion" as he called it as a guideline for the progress (in Musa & Jalil, 2013). As highlighted by Che Din (2011), social cohesion has been the pillar to several Malaysian governments' policy agendas since 1971. He claimed that social cohesion is necessary to guide policy agendas because it has the main social structures; material conditions, social order, positive interaction, social inclusion and integration, and social equality to inseminate national unity beyond ethnic and territorial divisions. Social cohesion is essential to achieve the nation's aspiration level of unity and social well-being. All things considered, both Musa and Jalil (2013), and Sivanandam (2015) said there are several challenges that need to be tackled to maintain the level of social cohesion in Malaysia, one of them is social participation.

Based on the Malaysia Quality Life Index, the focus should be on the three main components: family life, income distribution, and social participation. In a recent

empirical study by Bertelsmann on social cohesion in 22 societies in South, Southeast and East Asia, the level and trend of social cohesion were studied over a span of 11 years in two time periods; 2004 to 2008 and 2009 to 2015 (refer to Figure 1). This empirical study also highlights that economically thriving ASEAN countries show the highest level of social cohesion, while South Asian countries show lower level of social cohesion. The study further accentuates that modernization did not hinder social cohesion but strengthens it.

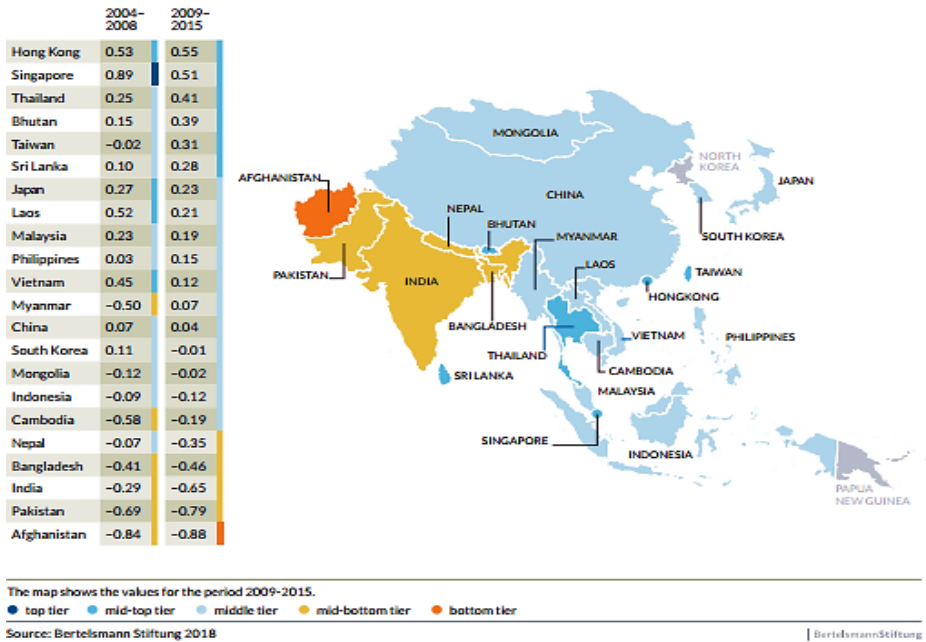

Figure 1 : A comparison on the level of social cohesion between 2004 to 2008 and 2009 to 2015 in South, Southeast and East Asia
(Source: Bertelsmann Stiftung, 2017)

The overall findings of the recent statistics (2009–2015) show that Hong Kong, Singapore, Thailand, and Bhutan yielded the highest level of social cohesion whereas Malaysia was found to remain in the third tier of medium cohesion among other Asian countries (Walkenhorst, 2018). This result was due to a very low level of trust and intolerance to diversity among Malaysians, which exhibit a downward trend in their social relations. Although Malaysians exhibited a high strength of social networks and a moderate level of diversity acceptance, their trust in people remained very low.

In terms of connectedness, Malaysia improved in their sense of identification with the community, high level of institutional trust, and perceived fairness through a high level of attachment and sense of belonging. In the third domain, Malaysia yielded a moderate level of doing a common good through medium level of

solidarity, low respect for social rules, and an inconsistently level of civic participation (refer to Table 1). Unlike the Western society's cohesion study by Delhey and Dragolov (2016), the economic and social modernization of Asian countries does not guarantee a high level of social cohesion, but a successful modernization does help strengthen social cohesion.

Urbanization can result in increased income disparity, increased reliance on the government, and a loss of social cohesiveness due to a lack of social responsibility, no social cohesion activities, or a decrease in the practice of good values within society (Mohamad, Jusoh, & Kassim, 2019). Burhan, Sidek, Kurniawan, and Mohamad (2015) found socioeconomic inequalities within a national society can lead to a loss of social cohesion. Socioeconomic equalities are the cause for positive group bonding through the sharing of collective values, purpose in a society, and have a sense of togetherness and belonging for individuals from various backgrounds.

According to Bertelsmann's study, cultural orientations such as religiosity, acceptance of hierarchies and collectivist values have no influence the level of togetherness. They argued that democracy and social cohesion has a negative relationship due to its openness and inclusion, which can be disposed to different opinions and expressions, thereby causing a deflation in social cohesion. This issue was further identified by Awang, Ahmad, and Rahman (2017), they claimed that most of the respondents said they appreciate various ethnic cultures and tolerate other socio-cultural groups, however they lacked cooperation and cultural adaptability. Hence, Bertelsmann encouraged the active participation of all parties in the community to play their roles in promoting the spirit of harmony, especially among youths.

Overtime, the level of social cohesion in Malaysia may be stable but the comparison over the span of 11 years has shown a decline in interpersonal trust as it dropped from low to very low, acceptance of diversity has dropped from high to medium, and solidarity has dropped from high to medium. As emphasized in Bertelsmann's study (Walkenhorst, 2018), the low level of interpersonal trust and low acceptance of diversity may be due to Malaysian's view of unity is within their own community compared to diverse communities leading them to be ethnocentric, which is a feeling of pride for being superior to others.

The pride for being superior may widen the racial division gap among youths (Gill et al., 2012). Equally, Burhan et al. (2015) argued that people tend to trust others with whom they share similar social and cultural characteristics, or else it would discourage their cooperation with others. This study also provided a review of social cohesion in 22 Asian countries, which shows that cultural diversity has no apparent effect on social cohesion unless the degree of ethnic and cultural diversity is high, it could reduce social cohesion.

Table 1 : The trend of social cohesion in Malaysia and its nine dimensions over time

Trends of social cohesion	2004-2008	2009-2015
Overall index of social cohesion	0.23	0.19
1.1 Social networks	0.57	0.53
1.2 Trust in people	-0.81	-1.06
1.3 Acceptance of diversity	0.51	0.18
2.1 Identification	0.06	1.08
2.2 Trust in institutions	0.55	0.58
2.3 Perceptions of fairness	0.35	0.47
3.1 Solidarity and helpfulness	0.66	-0.11
3.2 Respect for social rules	-0.34	-0.33
3.3 Civic participation	0.49	0.34

Note: Scores stem from factor analyses and represent relative standard deviation distances from the average case. No absolute comparisons and statements are possible. The color of the cells indicates the society's position relative to the other 21 countries: dark blue for top tier (very high cohesion), blue for second tier (high), light blue for middle tier (medium), yellow for fourth tier (low), and orange for bottom tier (very low). Dotted cells designate dimension scores that were estimated based on the other time.

(Source: Bertelsmann Stiftung, 2017)

The role of youth in enhancing social cohesion

Youths represent 46.6% of the Malaysian population and they are important in forming the political (electoral), social (cohesion), and economic (human capital) sectors in the country (Ministry of Rural Development, 2016). Youth being the highest percentage age group, are considered an asset in determining the country's direction and success. Youths can grow a nation and strengthen the foundations of national unity. Therefore, youth recognition and contribution are critical since they are important assets and represent the next generation of national leaders.

The first role is to understand and respect the diversity of our ethnic cultures in Malaysia. Gill et al. (2012) insinuated the importance of this group because youths often interact with various ethnic groups during their studies and during participation in co-curricular activities at campus. The issue of 'racial polarization' has been steadily worsening in our universities, which is why ties of friendship, toleration and mutual respect are very important. Second, the principle of Rukun Negara dictates the role of youths in upholding moral values and spirituality in the lives of people and society. This is because society sees youths as a repository of knowledge, and they must behave in a manner that is consistent with good morals and spirituality. Third, youths should communicate responsibly and competently to the authorities to strengthen national unity in Malaysia. The opinions of youths are in this way, important and should be developed by means of various channels, especially through their most sought out medium, the social media.

The Institute for Youth Research Malaysia (IYRES) under the Ministry of Youth and Sports has been conducting the Malaysian Youth Index studies since 2015 with 12 domains to measure the quality and well-being of youths in Malaysia. This study involved youths aged 19 to 30 years old and notably the score for Social Relationship and Identity domains have been decreasing throughout the years. The Social Relationship domain has three main indicators to measure the level of cohesion between individuals: the relationship between parents/ family, society, and friends while the Identity domain has five main indicators but for this study the researcher focused on the sense of unity and integrity.

The difference in score for the Social Relationship domain have been decreasing from 78.18 (Satisfactory) in 2015, 78.06 (Satisfactory) in 2016, 74.94 (Moderate) in 2017, to 74.45 (Moderate) in 2019. Meanwhile, the Identity domain score have been decreasing from 69.14 (Moderate) in 2015 to 68.39 (Moderate) in 2019. Therefore, both domains have been moderating throughout the years (Institute for Youth Research Malaysia, 2020). This score shows a lack of association between youth and their surrounding community or neighbors, which causes their relationship to be tenuous.

The lack of association between youth and their surroundings may be because of more communication opportunities such as through social media networks, which limits their quality time to face-to-face interaction with family, friends, and neighbors. In another study that focuses on the same age group by Awang et al. (2017) shows that social integration practices among multi-ethnic youths in Malaysia were moderately high. This finding was because most of them often practiced social acceptance and cultural appreciation but practiced less cooperation and cultural adaptation.

To ensure continued social cohesion in Malaysia, Mu Hung (2014) disclosed that first, the people should craft a more inclusive nationhood and to empower non-Malay/Muslim indigenous people, meanwhile Musa and Jalil (2013) further accentuate that social cohesion can be maintained if Malaysians focus on social participation. However, celebrating diversity is difficult because cultural adaptation was determined to be the most challenging action among multi-ethnic youth since practicing with other ethnic groups was one of the least common types of behavior regardless of ethnic background, they attempted to communicate with others using the national language (Marzbali, Abdullah, Abd Razak, & Tilaki, 2014).

Social acceptance, multicultural awareness, and effective communication among youths

Social acceptance is crucial for tolerance, when the opportunity to communicate with others is effectively obtained, tolerance levels will rise until there is no longer a feeling of prejudice but rather a willingness to recognize, appreciate, and instill national identity beyond their own ethnic identity (Awang et al., 2017). West

(2018) agreed that managing social cohesion in an emerging Asian country is challenging, when youth adopt Western behaviors, they tend to live with modern values.

One factor that is driving social unrest is endemic corruption, which erodes trust. This is also the reason why Hong Kong, Singapore, and Japan yield the highest level of social cohesion in Bertelsmann's study, they exhibit very high levels of interpersonal trust, high acceptance for diversity, perceived fairness, and high respect for social rules (West, 2018). Saripudin and Komalasari (2015) said that the tolerance is an important indicator for cohesion success because it leads to a unified and harmonious society. There is still a gap in diversity tolerance, especially among youths in Malaysia.

Despite various efforts and programs carried out because of these policies, the level of patriotism, tolerance, and unity is still at an unsatisfactory level. There should be more studies done to see the integration of increased diversity in Malaysia (Yassin, Dahalan, Abdullah, Ismail, Hamzah, Ahmad, & Serit, 2013). Youths from Sabah and Sarawak should be included in studies to allow for generalizations across the board in the aspects researched, and an experimental research project to develop a module to enhance patriotism and racial tolerance among the youth of different ethnic groups in Malaysia.

Past study by Yassin et al. (2013) has illustrated Bumiputera's readiness to celebrate ethnic diversity. They found a significant difference between respondents living in rural areas compared to the urbanites; the rural communities were more willing to accept diversity than their urban counterparts. Hence, youth commitment to national identity tended to be higher in the rural than for youth in urban areas. This finding was similar to a study in the past by Ibrahim (1980), the reason for this may be due to fact that the rural areas are mainly dominated by indigenous people, especially the Malays.

Malaysia being a plural society is a challenge to disseminate social cohesion. According to Hofstede's cultural dimension study (Minkov & Hofstede, 2012), Malaysians scored 36 in preference for uncertainty avoidance, and they are relational people in nature, which means they value friendships, knowing other's beliefs, and values relational uncertainty. Even Gudykunst and Nishida (2001) claimed that uncertainty avoidance creates anxiety, for this reason, Hofstede insinuated the need for uncertainty avoidance because uncertainty makes people feel anxious.

In Malaysia, it is imperative to communicate effectively with people of different cultures. Gill et al. (2012) also highlighted the importance of sharing principals and moral values in a plural society but within the Malaysian context, cohesiveness is demanding because it is affected by prominent issues like distrusts, ethnic conflict, suspicion, and dissatisfaction, which continue to be a

concern for the Malaysian government (Musa & Jalil, 2013; Shamsuddin, Liaw, & Ridzuan, 2015).

Social acceptance, ethnic tolerance, and effective communication are all connected in enhancing cohesion but first, people must first learn to manage their feeling of distrust and prejudice (Mu Hung, 2014). Hence, Awang et al. (2017) solicited that social attitude like awareness of diversity and acceptance of similarities and differences needs to be disseminated between the communities. The rapid diffusion of communication technology has made intercultural communication easy, practical, and inevitable.

As discussed previously, daily Medias in Malaysia have been bombarded with evidence of low trust, low respect for social rules, lack of solidarity and identity (Institute for Youth Research Malaysia, 2020; Gill et al., 2012; Mu Hung, 2014; Musa & Jalil, 2013; Talib & Jawan, 2012; Walkenhorst, 2018), and other problems caused by failed intercultural communication.

Nowadays, intercultural communication is made easy through social network site, however, communication skill is culturally distinctive; what is effective in one culture may not be effective in another. Because culture permeates all form of communication, it is crucial to understand its influences on communication skills. Often, personality factors such as your degree of assertiveness, extroversion, or optimism may be more influential than culture (Devito, 2009).

1.2 Statement of research problem

In the era of technological advancement, 11.5% of internet users in 2020 spent more than 18 hours online compared to merely 8.1% in 2018. The top five online activities among 93.3% Malaysians were spent on social networking sites due to its easy access and rapid process (Malaysian Communications and Multimedia Commission, 2020). Built as a micro-blogging technology, social networking sites support interactive activities with lower word posts and user-friendly features (Yusop & Sumari, 2013). Social networking sites were found to be a factor that can influence and change people's perception, which may trigger public interest and create hatred (Chinnasamy & Manaf, 2018; Marlowe, Bartley, & Collins, 2017).

According to the Global Digital Report 2018 (2018), 75% of the Malaysian population (24 million) were active social networking sites users, and their internet usage frequency is nearly every day (83%). Most internet users resided in urban areas (67.2%) while the remaining (32.8%) lived in the rural areas. On average, Malaysians spent at least 3 hours per day on social networking sites. Notably 59% of their weekly smartphone online activities were spent scrolling through social networking sites. About 89.3% of Malaysians used the internet to

access their social networking sites, by far their favorite platform to spend on were Facebook (97.3%), Instagram (56.1%), YouTube (45.3%), and WeChat Moments (43.7%) (Malaysian Communications and Multimedia Commission, 2017).

Virtual community members have the tendency to discuss problems of public interest when they assemble online, and if the issue is addressed by many, more users tend to join the bandwagon to keep up with what is going on. The topic of interest could heat up when users disagree with each other. For example, peer engagement on social media has a huge impact on Malaysian youth's political opinions, particularly when it comes to voting (Hassim, Zian, & Jayasainan, 2020). Findings revealed that Malaysian youths are easily influenced by their social connections, resulting in stronger interaction in virtual communities.

Previous researcher's findings have focused on the concept of social cohesion in offline domains; the lack of interpersonal trust, diversity acceptance and tolerance, solidarity and helpfulness, low respect for social rules, cooperation and cultural adaptation, association and participation, and racial polarization issues could fluctuate the level of social cohesion due to the ineffectiveness of communication between diverse communities (Awang et al., 2017; Institute for Youth Research Malaysia, 2020; Gill et al., 2012; Musa & Jalil, 2013; Saripudin & Komalasari, 2015; Walkenhorst, 2018).

As a collectivist country, Malaysia has the support of people from diverse backgrounds, but different customs have significant impact on employee's social behavior and proved to be difficult for managers to unify diverse employees (Shaari, Subramaniam, & Hassan, 2020). Each ethnic group has different beliefs and ideologies that influences how they think, make decisions, and direct an organization directly or indirectly. Hence, everyone is responsible for the entire group to function, for instance, one's way of conveying a message to the community shows how much they spend time getting to know each culture interpersonally and socially before any communication transaction. Because of this multicultural awareness, the members are mindful of each other and avoid offending other members.

An effective communication in a plural society is challenging because it requires mindfulness, trust, and positive social attitude rather than a mere exchange of facts. These identified problems call for study on the area of conflict, deficiencies in evidence, and controversies surrounding the phenomenon. Therefore, the real gap lies in the youth digital practices because daily engagement is not only limited to face-to-face but also digitization (Harris & Johns, 2021).

Looking at youth online practices in Malaysia, a sense of shared purpose and belonging can be difficult to develop when the validity of some virtual community members is questioned, and social inclusion is threatened. Everyday

interpersonal negotiation, debate, and participation (rather than homogeneity) are seen as critical in a culturally diverse community's continual process of cohesion and active engagement by all members (Harris & Han, 2020; Walton, Harris, & Iwabuchi, 2020).

Some of the common risks to social cohesion are prejudice, racism, discrimination, and bias because adolescents who went through these problems suffered from intergroup social exclusion (Cooley, Burkholder, & Killen, 2019). It was also found that ethnic majority adolescent holds implicit and explicit ingroup biases about race, those who came from high levels of exposure to racial diversity were less racial bias (Cooley et al., 2019).

To achieve Vision 2030's goals, it is important to consider the nation's unity and social cohesion as well as economic progress. Social inclusion is a matter of the National Identity formulation, which is the population's sense of belonging, sense of togetherness and social trusts. However, to this day social inclusion is low due to low interethnic trust, low social integration (Hung, 2014; Jabatan Perpaduan Negara dan Integrasi Nasional, 2016; Lim, Hassan, Ghaffarianhoseini, & Daud, 2017), medium social cohesion, low level of trust, low respect for social rules, and intolerance to diversity (Walkenhorst, 2018), especially among youths (Institute for Youth Research Malaysia, 2020). However, up to date there is no study of social cohesion that focuses on multi-ethnic youth communities in Malaysia (inclusive of Sabah and Sarawak) because this age group lacks association with their surrounding community, which reasons their moderate level of social relationship and sense of identity (Institute for Youth Research Malaysia, 2020).

Despite the issues mentioned previously (e.g., low level of trust, low respect for social rules, low participation, and intolerance to diversity in Malaysia) on the ineffectiveness of communication between diverse communities, Yassin et al. (2013) found rural youths were more prepared and accepting of diversity due to integration in their social environment than those observed in urban cities. There is a lack of empirical research that focuses on finding the differences between rural and urban youths' level of social cohesion and how they enhance their sense of social cohesion. Thus, the broad definition of this concept has clearly asked for more studies to be done in the communication field, especially between two localities.

So far, the micro-level of social cohesion is based upon the dependence of individuals and others in an advanced society but the term itself has complex reviews. It is often confused with social solidarity, social capital, and social integration. Again, Bruhn (2009a) highlighted that social cohesion is characterized by psychological outcomes such as levels of anxiety and depression when it is absent and was uncertain about how cohesiveness is conceived, supported, and maintained.

Most social cohesion studies are deductive in nature with the objective of verifying a theory rather than develop it like the social exchange theory by Homans (1958). The theories of social cohesion ranging from group dynamic theories to social exchange theories, they have become a framework for the entire social cohesion phenomenon and the organizing model for research questions. In the past, the phenomenon of social cohesion was first identified as social solidarity and the duration of a person's membership to their group.

Later, the phenomenon is elaborated to include the process by which each group member shapes the conditions of their environment. Nowadays, scholars have recognized this phenomenon should focus on everyone's decisions to remain in or leave a group to explain about their attitudes and about their group membership. Since the phenomenon of social cohesion is quantitative in nature, the research questions begin with a 'why' to explain about a phenomenon (Creswell & Creswell, 2017). Therefore, in trying to answer the study's research questions, the researcher uses a deductive approach instead of an inductive approach.

Many studies in the past have focused on social capital factors such as social network, social trust, and shared goals in face-to-face interpersonal relationships in an organizational setting (Chow & Chan, 2008) or electronic commerce (Hsu, Ju, Yen, & Chang, 2007; Valenzuela, Park, & Kee, 2009). However, based on a systematic literature review on the trend of social cohesion studies dated from year 2015 until 2020 (refer to Figure 2, page 15), none of the studies on social cohesion investigated the feeling of distrust such as anxiety/uncertainty and prejudice to be a causal factor for ineffective communication, which in turn hinders the sense of social cohesion among youths in virtual communities.

1.2.1 Systematic literature review on social cohesion studies in Malaysia

To fully understand the recent social cohesion phenomenon in Malaysia, the researcher ran a systematic literature review. The relevant criteria of the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines and diagram are used in this review (Moher, Liberati, Tetzlaff, & Altman, 2010). PRISMA plots the number of records discovered by search engines, the included and excluded criteria, and the basis for exclusions.

The guidelines allow a review of literature to be more systematic by pooling all supported studies relevant to the eligibility criteria to address a research question. This method is therefore suitable to minimize bias by using an unambiguous and systematic literature review. The first step is to conduct a search strategy through an academic electronic database such as Scopus, Google Scholar, and Dimensions. A criterion for the systematic search was established (refer to Table 2), the criterion includes keyword search and related text words known as the search string.

Table 2 : The inclusion and exclusion criteria for SLR

Criterion	Eligibility	Exclusion
Literature type	Journal articles	Books, conference proceedings
Year	2015-2020	Before 2015
Language	English	Non-English
Subject areas	Psychology, Social Sciences, Sociology, Behavioral Sciences, Social Issues, Ethnic Studies, Communication, Arts and Humanities, Urban Studies, Human Relations, Small Group, Human Communication or Cultural Studies	Computer Science, Business, Management and Accounting, Economics, Econometrics and Finance, Engineering, Medicine, Mathematics, Agricultural and Biological Sciences, Health Professions, Nursing, Energy, Neuroscience

The search was conducted using a search string consisted of a combination of exact keywords (i.e., Malaysia, youth, adolescence, community, social cohesion, social cohesiveness, group cohesiveness, cohesion, group cohesion, coherence, social collectivity, and social solidarity) referring to the article's titles, abstracts, and findings from recent published articles (since 2015 up to now) (refer to Table 3).

Using the exact keywords allow the database search to be more specific in searching for the right articles with related terms but at the same time the synonyms allow for similar contextual findings. In the previous section it was established that social cohesion used to be called social solidarity and group cohesion; therefore, the search string included the terms in case cohesion scholars still use the term to explain this phenomenon. The author tried to include as many related keywords as possible to include recent cohesion studies in Malaysia.

Table 3 : Search string used for the systematic review process

Databases	Keywords used
Scopus	((Malaysia) AND (youth OR adolescen* OR communit*) AND ("social cohesi*" OR cohesi* OR "group cohesi*" OR "social coherenc*" OR "social collectivity" OR "social solidarity"))
Google Scholar	allintitle: Malaysia youth OR adolescent OR community "social cohesion" OR cohesion OR cohesiveness OR "group cohesion" OR "social coherence" OR "social collectivity" OR "social solidarity"
Dimensions	(Malaysia) AND (youth OR adolescent OR community) AND ("social cohesion" OR cohesion OR cohesiveness OR "group cohesion" OR "social coherence" OR "social collectivity" OR "social solidarity")

To control the number of surfaced articles, the researcher included an inclusion and exclusion criteria. The author used Mendeley (Elsevier, Amsterdam) reference management software for the screening process, hence the criteria was useful to organize the articles. All things considered, the process of refining and excluding the articles were clarified in the PRISMA flow diagram below (refer to Figure 2).

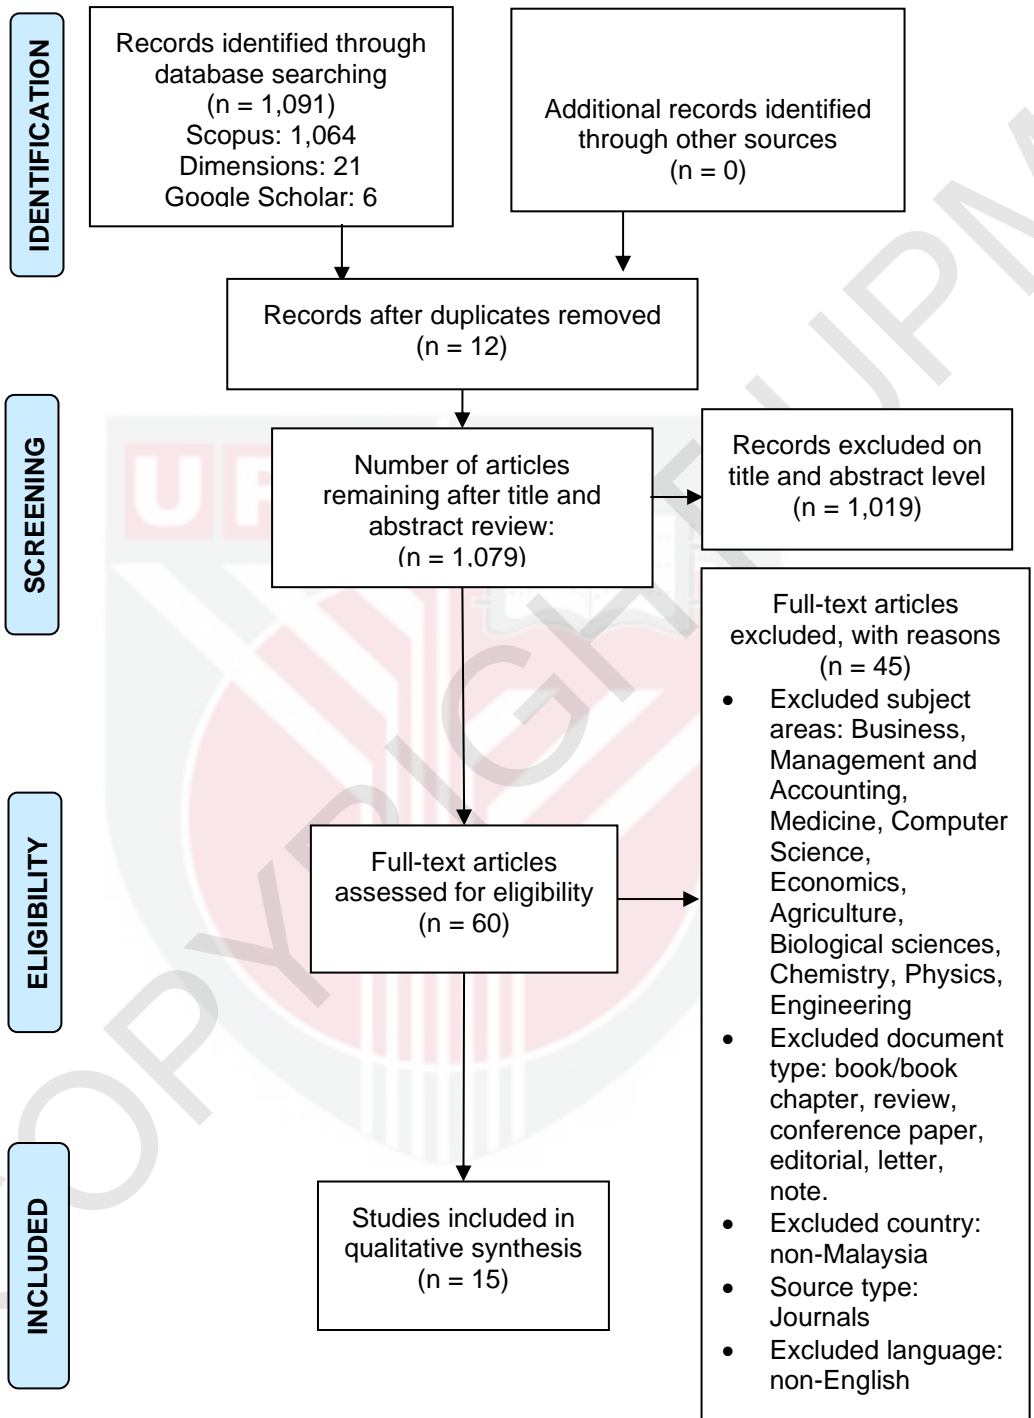

Figure 2 : The flow diagram of the systematic literature review
 (Adapted from Moher et al., and the PRISMA Group, 2009)

Altogether, 1,091 articles were assessed for relevance based on their titles, abstracts, and keywords. The resulted articles were screened in Mendeley, and 12 duplicated articles were removed, leaving 1,079 article abstracts to be reviewed. After screening every article abstract, only 60 full-text articles were retrieved from the three databases. The contents of the 60 full-text articles were read carefully to see whether they met the criteria of this systematic review; in total, only 15 studies were reviewed.

The scenario of social cohesion studies in Malaysia is dispersed. Looking back from 2016 until 2019, the number of studies that addressed the level of 'social cohesion' was negligible because not all of them referred to social cohesion directly and the theories used were inconsistent. Out of the fifteen studies, five studies have no mention of theory (i.e., Abdullah, Hassan, Ismail, Anuar, Din, Noor, Shahabuddin, Daud, & Hassim, 2018; Alavi, Mehrihezad, Amini, & Parthaman Singh, 2017; Din, Hassan, & Noor, 2019; Hassan, Abdullah, Noor, Din, Abdullah, & Ismail, 2018; Salizar, Munirah, & Arbon, 2019), but three studies have applied the social capital theory, which focused on neighborhood participation, neighborhood social trust, and interethnic interaction (i.e., Hamid, Marzuki, Ahmad, & Ishak, 2016; Kitab, Tamam, Bolong, & Sharif, 2016; Lim, Norhaslina, Amirhosein, & Md Nasir, 2017).

Although the three social capital studies did not mention the level of social cohesion, but they did emphasize on the role of social capital in enhancing community cohesion, effective communication, and social trust (Hamid et al., 2016; Kitab et al., 2016; Lim et al., 2017). Meanwhile, the rest of the studies reviewed have applied the theory of interdependence, theory of self-identity, the social cognitive theory, team-member exchange theory, ecological theory, social identity theory, ecological system theory, situational theory of problem solving, and contact and cohesion theory to explain the scenario of cohesiveness in Malaysia (i.e., Azlan, Kee, & Abdullah, 2018; Hassan, 2017; Kaur, Awang-Hashim, & Noman, 2017; Krauss, Kornbluh, & Zeldin, 2017; Sahharon, 2016; Sarwari, Wahab, Said, & Aziz, 2018; Tamam & Hashmi, 2016).

After reviewing all fifteen studies, only six studies addressed the level of cohesion among their sampled community in Malaysia. Overall, the level of social cohesion among rural youth community was only moderate (Sahharon, 2016), the perceived cohesion at a group level is influenced by factors like the level of collectivist cultural context and cooperative communication, the higher the level of these two factors the stronger group cohesion (Hassan, 2017), the level of social cohesion among business community was good if they have tolerance and care for each other (Abdullah et al., 2018; Din et al., 2019), the level of social cohesion among business community and hawkers was influenced by the increase of social capital factors like social networking (Hassan et al., 2018), and the level of social cohesion among flood victims in highly affected areas were high (Salizar et al., 2019). Overall, the fifteen reviewed cohesion studies conducted in Malaysia is very limited and the sampled population were a majority within the business community.

Previous researchers failed to address anxiety and uncertainty as a barrier to effective communication, like Ketab et al. (2016) and Tamam et al. (2016) highlighted in their studies on Malaysian samples (especially among youths), intercultural communication is important to help them feel closer and increase cooperation level because the more people feel secure and trust others around them, the more effective their interaction. All in all, cohesion studies on Malaysian population did not study virtual communities and how anxiety and uncertainty is managed among Malaysians to be able to communicate effectively, which in turn enhances their level of social cohesion.

It was mentioned in the Malaysian Youth Index 2020 study (Institute for Youth Research Malaysia, 2020) that Malaysian youths are avid users of social networking sites because it offers more communication opportunities, yet not many studies on social cohesion consider social networking sites as a platform for youths to communicate effectively with others, which can enhance their sense of social cohesion. Other than the lack of social cohesion study among virtual communities, theoretically speaking, social cohesion studies in the past have used various theories that were inconsistent to enhance social cohesion.

However, up to date, there is a scarcity of studies that use this theory as a basis to explain how people develop affective ties to their groups and maintain them, especially online. As asserted by Friedkin (2004), a good theory of social cohesion would deal with the social processes that link micro and macro levels of interaction and draws the framework to understand more on the effects of individuals' membership attitudes and behavior. The mentioned social processes include managing the feeling of anxiety and uncertainty towards others during communication.

In a multicultural society like Malaysia, the differences are vast. In consequence of social diversity, our beliefs, values, and social norms can result in negative outcomes such as irreconcilable differences and prejudice. To understand the contribution of individual social media users' contribution to social cohesion in today's digital environment, there is a need of a more differentiated investigation of the practices by which these youths relate to in different public spheres. Therefore, trying to engage the society to enhance the sense of social cohesion is challenging due to the notion of fear towards feeling uncertain and anxious. Hence, the researcher questions whether managing the level of anxiety and uncertainty in virtual communities can influence the level of social cohesion among youths in Malaysia.

1.2.2 Research questions

1. Can anxiety/uncertainty management influence the level of social cohesion in virtual youth communities?

2. Can anxiety/uncertainty management help facilitate communication effectiveness in virtual youth communities?
3. Is there a significant difference in the relationship between anxiety/uncertainty management and social cohesion between rural and urban virtual youth communities?
4. Is there a significant difference in the relationship between anxiety/uncertainty management and communication effectiveness between rural and urban virtual youth communities?
5. Does communication effectiveness mediate the relationship between anxiety/uncertainty management and social cohesion in virtual youth communities?
6. Does higher sense of multicultural awareness increase the relationship between anxiety/uncertainty management and communication effectiveness in virtual youth communities?

1.3 Research objectives

1.3.1 General objective

The main objective of this research is to determine the role of multicultural awareness (universal-diverse orientation) and communication effectiveness towards anxiety/uncertainty management and enhancing social cohesion in virtual youth communities.

1.3.2 Specific objectives

1. To determine the association between anxiety/uncertainty management and the level of social cohesion in virtual youth communities.
2. To determine the relationship between anxiety/uncertainty management and communication effectiveness in virtual youth communities.
3. To determine the difference in the relationship between anxiety/uncertainty management and social cohesion for rural and urban virtual youth communities.
4. To determine the difference in the relationship between anxiety/uncertainty management and communication effectiveness for rural and urban virtual youth communities.
5. To test the role of communication effectiveness on anxiety/uncertainty management and social cohesion in virtual youth communities.
6. To test the role of multicultural awareness on anxiety/uncertainty management and communication effectiveness in virtual youth communities.

1.4 Significance of the study

Ethnic social closeness and intolerance of uncertainty were found to be mediators of anxiety symptoms in a previous study by Liao, Weng, and West (2016). In the association between perceived racial microaggressions and anxiety symptoms, social connectedness to one's ethnic community operated as a buffer, whereas intolerance of uncertainty acted as an exacerbating factor. Social cohesion is a difficult phenomenon to maintain among Malaysians due to its diversity, therefore this study aims to analyze social cohesion (micro level) and the antecedent factors (macro level) involved in enhancing it. Compared to the previous study by Liao et al. (2016), this study saw the antecedent's factors of cohesiveness to be anxiety and uncertainty management and multicultural awareness instead of a moderator. It is more crucial to consider the direct impact of anxiety and uncertainty management on communication effectiveness and social cohesion.

1.4.1 Contribution to knowledge

Although recently it was established that Malaysian level of social cohesion is only moderate due to low social trust (Mu Hung, 2014; Walkenhorst, 2018), low respect for social rules, low solidarity and helpfulness, low acceptance of diversity (Walkenhorst, 2018), and low social integration (Hung, 2014; Jabatan Perpaduan Negara dan Integrasi Nasional, 2016). It was noted earlier that in the past Hofstede (1997) claimed that Malaysians were tolerant towards diversity and accept ambiguity, but recent studies have proved otherwise.

Due to low social trust (Mu Hung, 2014; Walkenhorst, 2018), low regard for social laws, low solidarity and helpfulness, and low acceptance of variety, Malaysia's social cohesiveness is deteriorating (Walkenhorst, 2018). These challenges have prompted a consensus on the findings of an empirical study on elements that can help improve social cohesion. Based on the Malaysian Youth Index 2020, both the level of social relationship and sense of identity among youths in Malaysia were only moderate (Institute for Youth Research Malaysia, 2020). Distrust and prejudice need to be managed (Mu Hung, 2014), which was why Awang et al. (2017) solicited that social attitude like awareness of diversity and acceptance of similarities and differences needs to be disseminated between youth communities.

Malaysian youths are avid users of social network sites; they frequently socialize online more than they do in person (Malaysian Communications and Multimedia Commission, 2017). As youths spent more time with their virtual communities, they are bound to have established several personality traits that can affect their online relationships. Even though most online interactions are anonymous, online platforms provide web-based communication tools with common

characteristics that allow users to interact collectively and communicate effectively.

The features in social network sites could instill a sense of belonging, a sense of community, allow proximity despite distance, enable group formations so people whom they share similarities with can exchange ideas, and many more that are beneficial to enhance the level of social cohesion.

First, due to the limited scientific research on finding the solutions to manage and enhance the sense of social cohesion, especially among youths, this study contributes significantly to the body of knowledge regarding social cohesion within the virtual context. As depicted by Giardello (2014), to develop a generative theory of social cohesion one must analyze social cohesion at a micro-macro interaction level and understand what constitute the sense of social cohesion?

Through this study, two theories were applied and amalgamated (i.e., theory of relational cohesion and anxiety/uncertainty management) as a basis to understand how anxiety/uncertainty management through virtual community platforms, supplemented by effective communication and multicultural awareness, can enhance Malaysian youths' level of social cohesion.

This study's framework could guide future researchers to understand that anxiety and uncertainty with the influence of multicultural awareness, can affect effective communication, which in turn help them feel socially cohesive. Accordingly, this study aims to contribute to the body of knowledge by serving as a focal point for information, knowledge, research, and development in relation to how interaction management in virtual communities can enhance social cohesion among online youths in Malaysia.

Secondly, it could be a good reference point for related parties, researchers and students who aim to further ascertain and explore factors that can enhance social cohesion. As depicted by Chan et al. (2006), social cohesion is an attribute of the inner community through relational dimensions rather than a process. The dimensions identified in this study are thematized in terms of macro and not just a generative process within from different local contexts.

The identified factors can influence positive online attitude, which could instill strong collective identity built on self-categorization and enabling social memberships to build a strong community. Data gained can be used to develop knowledge resources relating to the use of networked media outlets by Malaysians.

1.4.2 Contribution to practice

This study attempts to contribute to Malaysian youth's online socialization skills, which posit positive social attitude like the ability to manage anxiety and uncertainty within virtual communities and enhancing social cohesion. The government and related institutions can apply social networking sites in a variety of ways to bring its initiatives or messages closer to the people, such as employing social media as a tool for community accountability and transparency.

Furthermore, new media made possible by the internet revolution, such as YouTube, Twitter, Facebook, WhatsApp, and others, can serve as a platform for promoting activism and aiding its organization. As a result, the involved parties can encourage the use of social networking sites to empower local involvement (Parsons, 2005) and effective engagement between multi-ethnic youth communities (Mansor, 2014; Marzbali et al., 2014) as it helps sustain good sense of cohesion.

Other than granting visibility, socialization skills like anxiety/uncertainty management, frequent participation between virtual community members can help enhance social participation and increase perception of equity. This is due to the members perceiving that they share similar interests, solidarity, and aspiration, which then leads to effective communication and enhances social cohesion.

The study provides a platform on how socializing online encourages belonging, togetherness, social trust, and social interaction through being mindful, accepting of diversity, managing the unknown and communicating effectively. It contributes to the practice in a sense that it points to key areas that enhance social cohesion among virtual community members. As social cohesion requires revision to enhance it, youths must be able to manage their anxiety and uncertainties through virtual communities, adjust to the changes in their social environment, and diminish social exclusions.

1.4.3 Contribution to policy

In Malaysia, social cohesion is like a guideline for policy agenda since 1971 (Che Din, 2011). The concept of social cohesion is useful as a policy tool for social capability (Woolcock, 2011), social capital (Putnam, 2000), social inclusion (Michael & Nika, 2009), social mobility (Che Din, 2011), and collective efficacy (Soboroff, 2012), in response to the challenges that can disrupt a harmonious community. Such challenges can emerge from issues like the lack of inclusion, anxiety due to uncertainties, lack of trust, prejudice, and inequality.

The main cause to low social cohesion is primarily due to the failure of intercultural communication management among members of the community, which can lead to social, cultural, and political discrimination. Hence, to improve intercultural communication is through cultural sensitivity, acceptance, or multicultural awareness, reduce ethnocentrism, reduce stereotypes, be mindful, recognize differences, and effective communication.

Throughout this study, findings can help as a means of guiding policy for enhancing social cohesion. Understanding the micro-macro interaction process of social cohesiveness can be both a prerequisite for development and a critical component of the National Youth Development Policy (1997); for example, the policy outlined several elements that will contribute to a holistic and harmonious Malaysian youth force embedded with strong spiritual and moral values (Ministry of Youth and Sports Malaysia, 1997).

Among the strategies to realize the policy is the implementation of attitudinal development as a response to the development of a positive and creative attitude, improve facilities for social interaction to promote healthy interactions and social activities, and international relations and networking to further encourage closer ties with other communities. This study help provides understanding on the ability of virtual communities to manage the sustainability to improve youth identity, or the ability of representative institutions to facilitate reformation of youth social interaction rules.

1.5 Definition of keywords

1.5.1 Social cohesion (SC)

Overall, social cohesion is a property of togetherness that includes positive membership attitudes, behaviors, and the capacity of the resulting force of group members to ensure the welfare of all members, minimize disparities and polarization, strive for common goals, and have strong membership attraction and attachments. These properties deal with the social processes that link micro-macro interaction level outcomes, and ultimately influence individual behavior to coexist peacefully. Although social cohesion is a multi-faceted process, its indicator can be broken down into four main dimensions: social interaction, sense of togetherness, sense of belonging, and social trust.

1.5.2 Youth

The definition of youth in this study is based on the Akta Pertubuhan Belia dan Pembangunan Belia 2007 (Act 668) or the National Youth Development Policy in 1997, which defined youth as “those aged between the age range of 15 to 40”

(Ministry of Youth and Sports Malaysia, 1997). The focus on this group is due to youth as the key asset in determining the direction and success of Malaysia in becoming a developed country. Youth is also the main age category (Department of Statistics Malaysia, 2018a, 2018c) to have moderate social relationships, sense of identity (Institute for Youth Research Malaysia, 2020), and moderate sense of social integration (Awang et al., 2017). Although they lack association and cooperation, they are the most active social media users (Global Digital Report, 2018), which is why the researcher wanted to determine how their online social interaction management can enhance their sense of social cohesion.

1.5.3 Anxiety/Uncertainty Management (AUM)

The definition of anxiety/uncertainty management in this study is inspired by Gudykunst's (1995) anxiety and uncertainty management theory. Gudykunst refers to Anxiety/ uncertainty management as the "central processes of influencing the effectiveness of our communication with others". Anxiety/ uncertainty management is an extension from uncertainty reduction theory by Berger and Calabrese (1975), which is revised to explain communication competence towards effective interpersonal and intergroup communication.

The feeling of anxiety/uncertainty is managed through seven superficial causes as he calls it; personal/social identity, motivation to interact, reactions to strangers, social categorizations, situational processes, connections to strangers, and perceived effectiveness of communication.

1.5.4 Communication effectiveness (CE)

As a result of anxiety and uncertainty management process, Gudykunst defined effective communication as the "process of sharing information between entities in a way to create a mindful perception that is received in a positive manner" (Gudykunst & Nishida, 2001). Within the context of intercultural communication, the communication is considered effective when the information shared is conveyed and received efficiently without the intended meaning being distorted or changed.

1.5.5 Universal-Diverse Orientation (UDO)

Universal-Diverse Orientation or multicultural awareness is defined as the "awareness of attitudes toward diversity" (Miville, Mohr, Sedlacek, & Gretchen, 2000). The phrase refers to a pleasant social attitude toward others that includes an awareness of both people's similarities and differences. UDO contains three attitudinal components made for several settings to reduce prejudice: realistic

appreciation (a cognition), comfort with difference (a feeling), and diversity of contact (a behavior) (Miville, Rohrbacker, & Kim, 2005).

1.5.6 Virtual community (VC)

A virtual community is defined as “a group of people who share common interests, feelings or ideas, or pursue similar goals over the internet or over any collaborative network” (Abfalter, Zaglia, & Mueller, 2012). A virtual community is also known as an online community platform created through social network sites such as Facebook, Instagram, WhatsApp, Twitter and more, which offers different functionalities with a wide range of interests and practices.

1.6 Summary

Throughout this chapter it was established that Malaysia is socially heterogeneous in a way that it is predisposed to social conflicts. In the past decades, even if scholars and policy makers focus a lot on social cohesion, their concern were mostly on the decline in social cohesion and how to enhance it. Due to a decline in social cohesion, the society faces social and political instability. Although the studies claimed that Malaysia’s social cohesion level is stable because the threshold is still within the middle tier of medium cohesion, a comparison between the two waves shows otherwise; there is a declining trend in diversity acceptance, trust in people, and solidarity. The research problem shows that due to the immense use of technology, most Malaysian youths rely on social network sites to keep in touch with acquaintances, friends, and loved ones. They prefer spending time online to become part of the virtual community. A virtual community is a go to social platform among Malaysian youths to give and receive social support. Based on the reviews, the researcher posed six research questions on whether social networking sites can sub as a social platform to communicate effectively while managing their anxiety and uncertainty online and enhance social cohesion. In the next chapter, the researcher discusses further on how anxiety/uncertainty management can enhance social cohesion virtually and the factors involved in determining its strength.

BIODATA OF STUDENT

Hamizah Sahharon was born in Kedah on August 25th, 1991. Hamizah received her Master's degree (Communication Technology) in 2016 and completed her Doctor of Philosophy degree in the field of Human Communication under the Faculty of Modern Languages and Communication, Universiti Putra Malaysia (UPM). She worked as a Research Assistant at the Institute for Social Science Studies (IPSAS), UPM for six years before transferring to the Institute for Youth Research (IYRES) under the Ministry of Youth and Sports Malaysia as a Corporate Communication Executive at the beginning of 2020. She is now currently working as a Senior Research Executive at the same Institute and is currently building a Malaysian Youth Mental Health Index funded by UNICEF Malaysia with fellow researchers. Her growing interest in positive youth development as an approach to promoting the health and welfare of young people derives from the realization that there is more to understand regarding healthy development.
