ELASTIC, ELECTRICAL AND THERMAL PROPERTIES OF TELLURITE GLASS SYSTEMS

By

HALIMAH MOHAMED KAMARI

February 2007

Chairman : Associate Professor Sidek Haji Abdul Aziz, PhD

Faculty : Science

Three series of tellurite glass were synthesized by melt quenching technique. The binary tellurite was (TeO$_2$)$_x$ (B$_2$O$_3$)$_{1-x}$ with $x = 60, 63, 65, 70, 73, 75, 78, 80$ mol%, the ternary tellurite $[(\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}]_{1-y} [\text{Ag}_2\text{O}]_y$ consists of three series that is $x = 60, 65$ and $70$ mol% with $y = 10, 15, 20, 25$ and $30$ mol% and quaternary tellurite glass $\{[(\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}]_{1-y} [\text{Ag}_2\text{O}]_y\}_{1-z} \{\text{AgI}\}_z$ with $z = 5, 8, 10, 13, 15$ mol%. The experimental investigation was divided into two categories. The minor experimental work, which provides supportive evidence to elastic and electrical properties, consists of work on x-ray diffraction, thermal expansion coefficient and optical absorption spectra. The main experiments consist of work on ultrasonic and electrical measurements. The electrical measurements consist of dielectric and ac conductivity properties were measured at low frequencies from $10^2$ to $10^6$ Hz while ultrasonic properties were determined with MATEC 8000 at 5MHz resonating frequency and at room temperature.

The amorphous structures of the glass samples were evident by the XRD spectrum. Thermal expansion measurement showed that thermal expansion coefficient was composition dependence. The optical absorption spectra of these glasses were
measured, the Urbach rule has been applied to evaluate the fundamental absorption edges for all the glasses from the obtained spectrum. The optical band gaps were calculated from the absorption edge and it was found that the optical band gap energy, $E_{\text{opt}}$, depended on the glass composition. The optical band gaps energy showed a decreasing pattern with composition for binary and ternary tellurite glass however it behaves otherwise for quaternary tellurite glasses.

Elastic moduli were found dependent on compositions; for binary tellurite system the elastic moduli increased with the increase of TeO$_2$ and for ternary and the quaternary system elastic moduli decreased with Ag$_2$O and AgI respectively. The increase of elastic moduli for binary system was due to the mix former effect and the decreased elastic moduli for ternary was due to Ag$_2$O breaking the bonds of the borotellurite glass system while AgI iodide caused network expansion of the glass structure and weakened the glass structure of this quaternary tellurite system. The Debye temperature and mirohardness had the same trend as the elastic moduli but the Poisson’s ratio always the inverse of the elastic moduli.

The results of dielectric response measurements and the results of the equivalent circuit analysis show that electrode polarization at low frequency, orientation polarization at intermediate frequency and polarization of defect glass structure at high frequency are the most probable process responsible for the observed dielectric behaviour of the studied glass samples. The dependence of the alternating current conductivity with frequency at various fixed temperature revealed three distinguishable regions; high frequency dispersion, low frequency dispersion and
electrode polarization. The electrical conductivity of tellurite based glass was found to obey the exponential double power law.
SIFAT KENYAL, ELEKTRIK DAN TERMA SISTEM KACA TELURIT

Oleh

HALIMAH MOHAMED KAMARI

Pengerusi :   Profesor Madya Sidek Haji Abdul Aziz, PhD

Fakulti :   Sains

Tiga siri kaca telurit telah disintesis dengan teknik sepuh lindap. Telurit binari adalah \((\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}\) dengan \(x = 60, 63, 65, 70, 73, 75, 78, 80\) mol\%, telurit ternary \([[(\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}][\text{Ag}_2\text{O}]_y\] und \(x = 60, 65\) and 70 mol\% dengan \(y = 10, 15, 20, 25\) dan 30 mol\% and kaca telurit kuaternari \([[(\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}][\text{Ag}_2\text{O}]_y\] {AgI}_z\) dengan \(z = 5, 8, 10, 13, 15\) mol\%. Penyelidikan eksperimen terbahagi kepada dua kategori. Eksperimen minor yang memberi maklumat sokongan kepada ciri kenyal dan elektrik, terdiri daripada pembelauan x-ray, pekali pengembangan terma dan spektrum penyerapan optik. Eksperimen utama pula terdiri daripada pengukuran ultrasonik dan elektrik. Ciri dielektrik dan kekonduksian arus ulang alik diukur pada frekuensi rendah daripada \(10^2\) to \(10^6\) Hz dan ciri ultrasonik ditentukan dengan MATEC 8000 bergetar pada frekuensi 5MHz dan pada suhu bilik.

Struktur amorfus bagi sample kaca dapat dibuktikan menggunakan spektrum XRD. Pengukuran pengembangan terma menunjukkan bahawa pekali pengembangan terma bagi setiap siri kaca telurit adalah bersandar kepada komposisi. Spektrum penyerapan optik bagi kaca ini telah diukur, peraturan Urbach digunakan untuk...
mengukur asas pinggir serapan bagi semua spektra yang diperolehi. Jurang jalur optik telah ditentukan daripada asas pinggir serapan dan didapati tenaga jalur optik \( E_{opt} \) bersandar ke atas komposisi kaca. Tenaga jalur optik menunjukkan corak berkurangan dengan komposisi bagi kaca binari dan ternari tellurit tetapi berbeza sebaliknya untuk kaca kuaternari telurit.

Modulus kenyal didapati bersandar dengan komposisi; untuk sistem binari telurit modulus kenyal meningkat dengan penambahan \( \text{TeO}_2 \) dan untuk sistem ternari dan kuaternari modulus kenyal berkurangan dengan \( \text{Ag}_2\text{O} \) dan \( \text{AgI} \) masing-masing. Peningkatan modulus kenyal sistem binari adalah disebabkan oleh kesan campuran pembentuk dan pengurangan modulus kenyal untuk ternari disebabkan oleh \( \text{Ag}_2\text{O} \) memutuskan ikatan sistem kaca borotelurit di mana iodida menyebabkan pengembangan rangkaian struktur kaca dan melemahkan struktur kaca bagi sistem kuaternari telurit. Suhu Debye dan kekerasan mikro mempunyai corak yang sama dengan modulus kenyal tetapi nilai nisbah Poisson sentiasa songsang relatif kepada modulus kenyal.

Keputusan pengukuran tindakbalas dielektrik dan analisis litar setara menunjukkan pengutuban elektrod pada frekuensi rendah, pengutupan orientasi pada frekuensi pertengahan dan pengutupan oleh kecacatan struktur kaca pada frekuensi tinggi kemungkinan menjadi penyumbang besar proses yang menyebabkan kelakuan dielektrik bagi sampel kaca yang dikaji. Kebersandaran kekonduksian arus ulang alik dengan frekuensi pada beberapa suhu tertentu menunjukkan tiga bahagian; serakan frekuensi tinggi, serakan frekuensi rendah dan pengutupan elektrod. Kekonduksian elektrik bagi kaca berasaskan telurit didapati mematuhi hukum eksponen kuasa berganda.
First and for most I would like to express my deep gratitude to my supervisor, Associate Professor Dr. Sidek Haji Abdul Aziz, for his constant encouragement, constructive suggestions and continuous discussion throughout the project. I would also like to extend my sincere appreciation to my co-supervisors Associate Professor Dr. W. Mohamad Daud W. Yusoff and Dr. Zainul Hassan for their guidance, suggestion and comments throughout the research work.

My special thanks to Cik Yusnita (XRD) and Puan Wan Yusmawati (XRD), Puan Noriza Marlan, Cik Kamsiah and all the laboratory technicians for their help.

I am extremely grateful to all my lab mates and Emma Zizzie for their constant encouragements and help throughout these few years.

The financial support from the Ministry of Science and Technology and Universiti Putra Malaysia is grateful acknowledged. Without this support, it is impossible for me to pursue this project with success.

Last but not least, I would like to give my sincere thanks to all the members of my family for their love, continuous support, encouragement and understanding.
I certify that an Examination Committee has met on 15th February 2007 to conduct the final examination of Halimah Mohamed Kamari on her Doctor of Philosophy thesis entitled “Elastic, Electrical and Thermal Properties of Tellurite Glass System” in accordance with Universiti Pertanian Malaysia (Higher Degree) Act 1980 and Universiti Pertanian Malaysia (Higher Degree) Regulations 1981. The Committee Recommends that the candidate be awarded the relevant degree. Members of the examination Committee are as follows

**Hishamuddin Zainuddin, Ph.D**  
Associate Professor  
Faculty of Science  
University Putra Malaysia  
(Chairman)

**Abdul Halim Shaari, Ph.D**  
Professor  
Faculty of Science  
University Putra Malaysia  
(Internal Examiner)

**Mansor Hashim, Ph.D**  
Associate Professor  
Faculty of Science  
University Putra Malaysia  
(Internal Examiner)

**Muhamad Mat Salleh, Ph.D**  
Professor  
Principal Research Fellow/Professor of Physics  
University Kebangsaan Malaysia  
(External Examiner)

HASANAH MOHD GHAZALI, PhD  
Professor/Deputy Dean  
School of Graduate Studies  
University Putra Malaysia

Date:
This thesis submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfilment of the requirement for the degree of Doctor of Philosophy. The members of the Supervisory Committee are as follows:

**Sidek Haji Abdul Aziz, PhD**
Associate Professor  
Faculty of Science  
Universiti Putra Malaysia  
(Chairman)

**W. M. Daud W. Yusoff, PhD**
Associate Professor  
Faculty of Science  
Universiti Putra Malaysia  
<Member>

**Zainul Abidin Hassan, PhD**
Associate Professor  
Faculty of Science  
Universiti Putra Malaysia  
<Member>

---

**AINI IDERIS, PhD**
Professor/Dean  
School of Graduate Studies  
Universiti Putra Malaysia

Date: 10 May 2007
DECLARATION

I hereby declare that the thesis is based on my original work except for quotations and citations which have been duly acknowledged. I also declare that it has not been previously or concurrently submitted for any other degree at UPM or other institutions.

3.14 Frequency dependence of the polarization mechanisms in glass. Upper: contribution charging constant (representative value of $\varepsilon'$). Lower: contribution to the loss factor (representative value of $\varepsilon''$)

3.15 Schematic of polarization mechanism in a glass
a) electronic b) atomic or ionic c) high frequency oscillatory dipoles d) low frequency cation dipole e) interfacial polarization at heterogeneities

3.16 Different types of dielectric dispersion and conduction behaviour. Empty diamond shape is $\varepsilon'$ and filled diamond shape is $\varepsilon''$

3.17 Top showing the behaviour dielectric dispersion (real and imaginary part of permittivity) consists of combination of relaxation and quasi dc process. Below showing the corresponding conductivity as a function of frequency of the imaginary part of permittivity ($\sigma = \omega \varepsilon_0 \varepsilon''$).

3.18 Left: types of dielectric relaxation and conduction. Right: the corresponding modulus plot of each relaxation. Inset: model equivalent electrical circuit for relaxation and conduction

4.1 Schematic processes in glass preparation

5.19 Optical absorbance spectra for \([(\text{TeO}_2)_{70} (\text{B}_2\text{O}_3)_{30}]_{90} [\text{Ag}_2\text{O}]_{10}\) glasses

5.20 Plot of \((\alpha h \omega)^2\) against photon energy for direct band gap measurement for \([(\text{TeO}_2)_{70} (\text{B}_2\text{O}_3)_{30}]_{90} [\text{Ag}_2\text{O}]_{10}\) glasses

5.21 Plot of \((\alpha h \omega)^{1/2}\) against photon energy for indirect band gap measurement for \([(\text{TeO}_2)_{70} (\text{B}_2\text{O}_3)_{30}]_{90} [\text{Ag}_2\text{O}]_{10}\) glasses

5.22 Optical absorption coefficient against photon energy for \([(\text{TeO}_2)_{70} (\text{B}_2\text{O}_3)_{30}]_{90} [\text{Ag}_2\text{O}]_{10}\) glasses.
5.23 Suggested energy band diagrams (energy E versus wave vector, k) for tellurite glass system

5.24 Density and molar volume of (TeO_2)_x(B_2O_3)_{1-x} glasses

5.25 Density and molar volume of [(TeO_2)_{0.60}(B_2O_3)_{0.40}]_{1-y} [Ag_2O]_y glasses

5.26 Density and molar volume of [(TeO_2)_{0.65}(B_2O_3)_{0.35}]_{1-y} [Ag_2O]_y glasses

5.27 Density and molar volume of [(TeO_2)_{0.70}(B_2O_3)_{0.30}]_{1-y} [Ag_2O]_y glass

5.28 Density and molar volume of 
\{(TeO_2)_{0.70}(B_2O_3)_{0.30}\}^{0.9}_{10} [Ag_2O]^{1.1}_{10} \{AgI\}^z_z glasses

5.29 Ultrasonic velocity of (TeO_2)_x(B_2O_3)_{1-x} glasses

5.30 Ultrasonic velocity of [(TeO_2)_{60}(B_2O_3)_{40}]_{1-y} [Ag_2O]_y glasses

5.31 Ultrasonic velocity of [(TeO_2)_{65}(B_2O_3)_{35}]_{1-y} [Ag_2O]_y glasses

5.32 Ultrasonic velocity of [(TeO_2)_{70}(B_2O_3)_{30}]_{1-y} [Ag_2O]_y glasses

5.33 Ultrasonic velocity of 
\{(TeO_2)_{70}(B_2O_3)_{30}\}^{0.9}_{10} [Ag_2O]^{1.1}_{10} \{AgI\}^z_z glasses

5.34 Elastic moduli of (TeO_2)_x(B_2O_3)_{1-x} glasses

5.35 Elastic moduli of [(TeO_2)_{60}(B_2O_3)_{40}]_{1-y} [Ag_2O]_y glasses

5.36 Elastic moduli of [(TeO_2)_{65}(B_2O_3)]_{35} [Ag_2O]_y glasses

5.37 Elastic moduli of [(TeO_2)_{70}(B_2O_3)]_{30} [Ag_2O]_y glasses

5.38 Elastic moduli of \{(TeO_2)_x(B_2O_3)\}^{1.1}_{1-x} \{AgI\}^z_z glass

5.39 Variation of Poisson’s ratio with crosslink density for tensile stresses applied parallel to oriented chains. The force resisting lateral contraction increase with cross-link density: (a) crosslink density = 0; (b) crosslink density = 1; crosslink density = 2.

5.40 Poisson’s ratio and Debye temperature of (TeO_2)_x(B_2O_3)_{1-x} glasses

5.41 Poisson’s ratio and Debye temperature of 
[(TeO_2)_{60}(B_2O_3)_{40}]_{1-y}[Ag_2O]_y glasses
5.42 Poisson’s ratio and Debye temperature of \({[{\text{TeO}_2}]_x [{\text{B}_2\text{O}_3}]_{1-x} [{\text{Ag}_2\text{O}}]_y {\text{AgI}}_z}\) glasses

5.43 Micro-hardness and Transition temperature of \((\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}\) Glasses

5.44 Micro-hardness and Transition temperature of \([(\text{TeO}_2)_{60} (\text{B}_2\text{O}_3)_{40}]_y [{\text{Ag}_2\text{O}}]_y\) glasses

5.45 Microhardness and transition temperature of \([(\text{TeO}_2)_{70} (\text{B}_2\text{O}_3)_{30}]_y [{\text{Ag}_2\text{O}}]_y {\text{AgI}}_z\) glasses. Inset shows AgI = 0 mol% 

5.46 Softening temperature of \((\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}\) glasses

5.47 Softening temperature of \([(\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}]_y [{\text{Ag}_2\text{O}}]_y\) glasses

5.48 Softening temperature of \([(\text{TeO}_2)_{70} (\text{B}_2\text{O}_3)_{30}]_y [{\text{Ag}_2\text{O}}]_y {\text{AgI}}_z\) glasses. Inset shows AgI = 0 mol% 

5.49 Cross link-density of \((\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}\) glasses

5.50 The number of network bonds per unit volume of \((\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}\) glasses

5.51 The estimated atomic ring size of \((\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}\) glass

5.52 The calculated bond compression bulk modulus of \((\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}\) glasses

5.53 Variation of estimated atomic ring size with values of \(K_{bc}/K_e\) of \((\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}\) glasses

5.54 Variation of estimated atomic ring size with the value of \(K_{bc}/K_e\)

5.55 Packing density of \((\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}\) glasses

5.56 Dissociation energy of \((\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}\) glasses

5.57 Cross link-density of \([(\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}]_y [{\text{Ag}_2\text{O}}]_y\) glasses

5.58 The number of network bonds per unit volume of \([(\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}]_y [{\text{Ag}_2\text{O}}]_y\) glasses

5.59 Estimated atomic ring size of \([(\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}]_y [{\text{Ag}_2\text{O}}]_y\) glasses

5.60 Bond compression bulk modulus of \([(\text{TeO}_2)_x (\text{B}_2\text{O}_3)_{1-x}]_y [{\text{Ag}_2\text{O}}]_y\) glasses
5.61 Variation of estimated atomic ring size with values of $K_{bc}/K_e$ of $[(\text{TeO}_2)_x(\text{B}_2\text{O}_3)_{1-x}]_{1-y} [\text{Ag}_2\text{O}]_y$ glasses

5.62 Packing density of $[(\text{TeO}_2)_x(\text{B}_2\text{O}_3)_{1-x}]_{1-y} [\text{Ag}_2\text{O}]_y$ glasses

5.63 Dissociation energy of $[(\text{TeO}_2)_x(\text{B}_2\text{O}_3)_{1-x}]_{1-y} [\text{Ag}_2\text{O}]_y$ glasses

5.64 Cross-link density of $\{[(\text{TeO}_2)_7(\text{B}_2\text{O}_3)_{30}]_{90} [\text{Ag}_2\text{O}]_{10}\}_{1-z} [\text{AgI}]_{z}$ glasses

5.65 The number of network bonds per unit volume of $\{[(\text{TeO}_2)_7(\text{B}_2\text{O}_3)_{30}]_{90} [\text{Ag}_2\text{O}]_{10}\}_{1-z} [\text{AgI}]_{z}$ glasses. Inset shows AgI = 0 mol%

5.66 Atomic ring size of $\{[(\text{TeO}_2)_7(\text{B}_2\text{O}_3)_{30}]_{90} [\text{Ag}_2\text{O}]_{10}\}_{1-z} [\text{AgI}]_{z}$ glasses. Inset shows AgI = 0 mol%

5.67 Bond compression bulk modulus of $\{[(\text{TeO}_2)_7(\text{B}_2\text{O}_3)_{30}]_{90} [\text{Ag}_2\text{O}]_{10}\}_{1-z} [\text{AgI}]_{z}$ glasses. Inset shows AgI = 0 mol%

5.68 Variation of estimated atomic ring size with values of $K_{bc}/K_e$ of $\{[(\text{TeO}_2)_7(\text{B}_2\text{O}_3)_{30}]_{90} [\text{Ag}_2\text{O}]_{10}\}_{1-z} [\text{AgI}]_{z}$ glasses

5.69 Packing density of $\{[(\text{TeO}_2)_7(\text{B}_2\text{O}_3)_{30}]_{90} [\text{Ag}_2\text{O}]_{10}\}_{1-z} [\text{AgI}]_{z}$ glasses. Inset shows AgI = 0 mol%

5.70 Dissociation energy of $\{[(\text{TeO}_2)_7(\text{B}_2\text{O}_3)_{30}]_{90} [\text{Ag}_2\text{O}]_{10}\}_{1-z} [\text{AgI}]_{z}$ glasses
